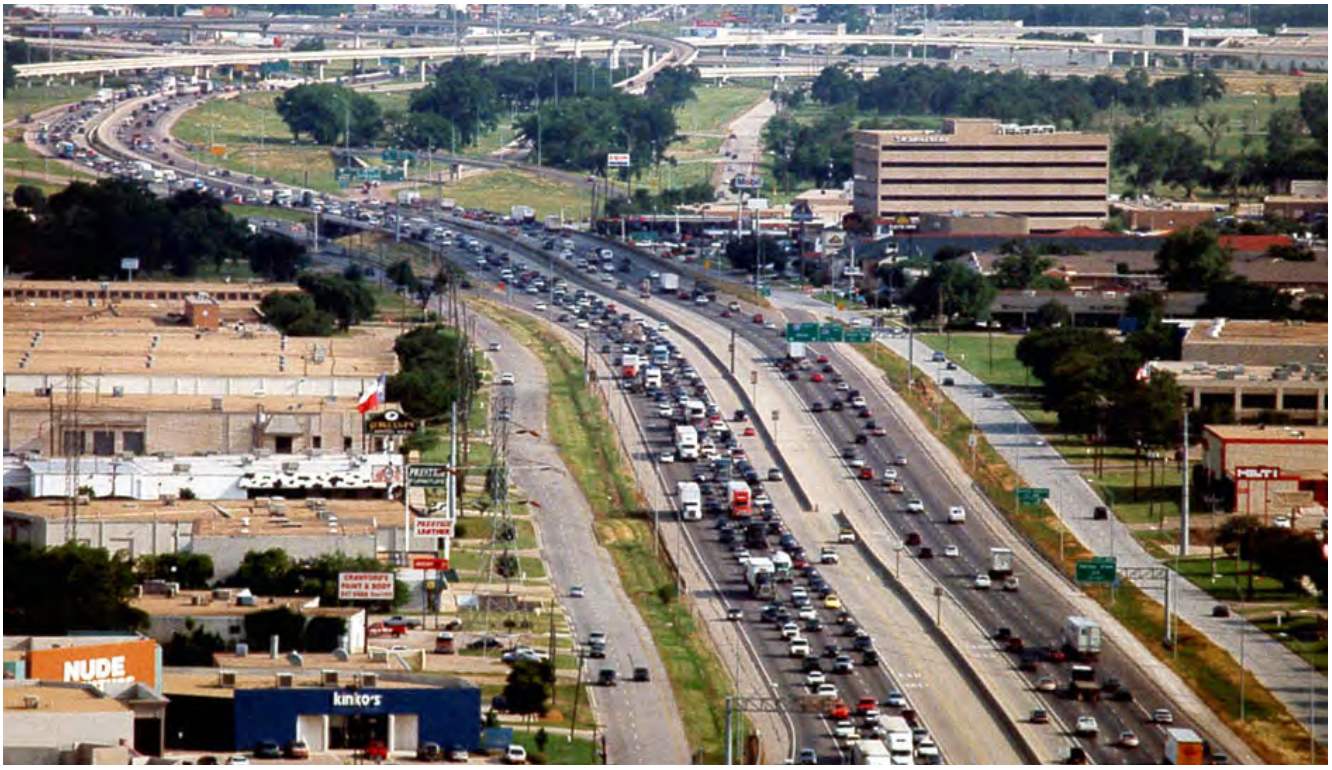
Preliminary VALUE ENGINEERING STUDY REPORT

Texas Department of Transportation
Dallas District

I-35E Managed Lanes Project



STUDY DATES: August 16-18, 23-25, 2010

REPORT DATE: September 2010

Prepared and Submitted by:
Martin Y. Hsu, PE, CVS & Associates, Inc.

(214) 214-223-4139 • Martin@MartinHsu.net • www.MartinHsu.net

Memorandum

Date: **September 5, 2010**

To: **All Recipients of Preliminary Value Engineering Report for I-35E Managed Lanes Project**

From: **Martin Y. Hsu, PE, CVS-Life**
Martin Y. Hsu, PE, CVS & Associates, Inc. (MHA, Inc.)

Martin Y. Hsu, PE, CVS & Associates, Inc. is pleased to transmit this Preliminary Value Engineering Study Report for the referenced project. To assist the reader in using this report, the organization and content of this report, as well as key definitions used in the VE Study Report, are described in the following pages. This report summarizes the results and events of the study conducted August 16-18, 23-25, 2010, in TxDOT-Dallas District Office, Dallas, Texas.

DECISION-MAKERS PLEASE NOTE: Please use the attached **VE Implementation Matrix** to provide your decisions and comments. You are asked to accept, conditionally accept, or reject each VE alternative included in this report. In addition, you will be asked to agree or disagree with the cost savings and performance measures ratings the VE team applied to each VE alternative that is accepted or conditionally accepted.

The VE process is complete only when the implementation decisions for every VE alternative have been received from the Project Manager and documented in the VE report. The *Assess Alternatives* and *Resolve Alternatives* activities provide the VE team, the Project Manager, TxDOT/TTA, and local stakeholders the assurance that the alternatives are properly evaluated and the implementation decisions are based on the merit of the alternative. This process helps to eliminate inaccurate study alternatives and legitimizes the results of the study.

If you have any questions or comments concerning the final report, please contact me at 214-223-4139.

Sincerely,

Martin Y. Hsu, PE, CVS-Life

Value Engineering Study Report Structure and Content

PURPOSE OF REPORT

To improve reader understanding of the VE Study Report, information relating to the organization of the report is provided. Key definitions are also provided. The Final VE Study Report will be circulated to the same parties who received a copy of the Preliminary VE Study Report. The Final Report documents changes made as a result of the comments received on the preliminary report, implementation decisions related to alternatives, and if appropriate, follow-up activities required for closing out the VE activities. In addition, key project information analysis that was integral to the development of the VE alternatives is included in this document.

A GUIDE TO READING THIS REPORT

The VE Study Report includes:

• **Transmittal Letter**	Letter from the VE Study Facilitator transmitting the report.
• **Executive Summary**	Overview of the project and the results of the VE Study.
• **VE Study Summary Report**	Database format summary to be used by the TxDOT VE Program Administrators for auditing and reporting purposes.
• **VE Alternatives**	Documentation of the findings of the value analysis of the project.
• **Project Analysis**	Documentation of the findings of the project derived from the VE tools.
• **Project Description**	Narrative of the project scope and cost that formed the basis for the VE Study.
• **Idea Evaluation**	List of all the creative ideas and their evaluations.
• **Value Engineering Process**	Description of the VE methodology employed by TxDOT, the study agenda, and participants.

The **Report Structure and Content** information is provided to assist reader understanding of the VE Report. The purpose and content of each section and key definitions are provided.

The first page of the **Executive Summary** provides a "Synopsis", a *very brief* summary of the VE Study and results. The Executive Summary itself elaborates on the Synopsis, providing brief descriptions of the project, issues associated with the project, the findings resulting from using the VE tools to analyze the project, and a summary of the key VE alternatives produced. Performance rating, developed by the VE team and decision-makers for the accepted VE alternatives, are presented.

The **VE Study Summary Report (VESSR)** is a database-format summary of study participants, activities, and results. It provides lists of VE alternatives proposed, accepted, and/or conditionally accepted, along with the cost and performance impacts of each alternative listed.

The **VE Alternatives** section presents in detail, including sketches, performance measures, assumptions and calculations in addition to cost estimates.

The **Project Analysis** section goes into some detail about the VE tools used by the VE team to analyze the project and discusses the results of those analyses.

The Project Description section elaborates on the scope of the project studies and provides a copy of the project cost estimate used by the VE team.

The **Idea Evaluation** section provides the reader with a list of the ideas generated by the VE team, how each idea was evaluated and ranked, and an understanding why certain ideas were not developed.

The **VE Process** section describes the VE Methodology. It includes detailed descriptions of the activities included in the VE Study process with special emphasis on the performance measures process used by the VE Team. A copy of the VE Study Agenda and the Meeting Attendance list are also provided.

Definitions of **Key Terms** used in VE Study Report are listed below:

Original Concept is the design solution that is used as the baseline for the VE Study. This can be either one of the EIS alternatives or the PS&E design, depending on the point in time that the VE study is being performed. The VE analysis, proposed changes, and cost and performance potential changes are all referenced against the original concept.

VE Alternatives are developed by the VE team as items to be considered as alternatives to either replace or enhance elements of the original concept.

Performance Measurement is a unique methodology developed to measure the effectiveness of the project scope of various alternatives. This permits the interrelationship between cost and performance to be quantified and compared in terms of how they contribute to overall value.

Initial Cost refers to the costs for construction, right-of-way, and support that are expended to complete the project and have it open to the public.

Subsequent Cost refers to operations, maintenance, and other costs that are necessary to keep the facility functioning over the projected life of the project. Typically, a 30-year life is used for life cycle cost comparisons (50 years for bridge structures).

Life Cycle Costs (LCC) consider all costs estimated for a facility over a designated time period (typically 30 years) and adjusts those costs to today's dollars so that alternatives that have different aspects can be compared, assisting in determining the most cost effective solution for the project.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

PRELIMINARY

SYNOPSIS

The proposed I-35E Managed Lanes project is approximately 28.0 miles long and extends from US 380 in Denton County to I-635 in Dallas County. The I-35E corridor serves as the primary route from Denton to Dallas and the project has been divided into three segments for analysis: south, middle and north. The geographical limit of each segment is derived from the city and county limits, economic activity, geometric configurations, and the traffic characteristics particular to each segment.

The limits of the segments are provided below:

- **South Segment:** I-635 to President George Bush Turnpike (PGBT)
- **Middle Segment:** President George Bush Turnpike (PGBT) to FM 2181/Swisher Road
- **North Segment:** FM 2181/Swisher Road to US 380

The planned improvements of this project are to widen the highway footprint and:

- increase the total number of the general purpose lanes from six to eight between I-635 and US 377
- increase the total number of the general purpose lanes from four to six between US 377 and I-35W
- increase the total number of the general purpose lanes from four to ten between I-35W and US 380
- add a barrier separated bi-directional managed lane facility
    - with four lanes from I-635 to US 77
    - with two lanes from US 77 to I-35W
    - with four lanes from I-35W to US 380

The total overall construction cost is currently estimated at $4.0 billion. This total includes the cost of all construction activity to deliver the planned facility, environmental mitigation, right-of-way, utility relocation, and all associated planning, design, and engineering.

The I-35E VE team identified twenty (20) key VE alternatives that were considered to address the functions of *Optimize Funding*, *Enhance Mobility,* and *Reduce Congestion.* All of the alternatives maintain functionality, offer performance improvements, an, reduce initial costs for construction and/or life cycle costs over the longer term.

The I-35E VE team developed two sets of alternatives to illustrate potential combinations that may be chosen for implementation. The alternatives included in the two sets are those deemed by the team to represent the best value when considering the impact of the alternatives on project performance and cost savings.

Two sets of alternatives were combined for consideration by the decision makers:

Set No.	Description	Initial Cost savings	Change in Performance	Change in Value
1	Maximize Affordability of Project	$2,208,000,000	-28%	+61%
2	Maintain Stakeholder Acceptance	$1,659,940,000	-1 %	+17%

INTRODUCTION

This Value Engineering (VE) Study Report summarizes the events of the I-35E VE study conducted for TxDOT by Martin Y. Hsu, PE, CVS-Life of *Martin Y. Hsu, PE, CVS & Associates, Inc*. The subject of the study is the 28-mile I-35E Managed Lanes project in Dallas and Denton Counties, Texas.

PROJECT DESCRIPTION

Existing Configuration

The existing I-35E is a six-lane freeway from I-635 to Quail Run just north of the Lake Lewisville Bridge and a four-lane freeway from Quail Run to US 380. The southern portion of I-35E from I-635 to SH 121 has an interim single lane concurrent high occupancy vehicle (HOV) lane in each direction. To implement this interim HOV lane, the three general purpose lanes in each direction were reduced to a lane width of 11 feet and the inside shoulder was reconstructed to provide space for the HOV lane.

Existing Condition

The section of I-35E under consideration for this project was constructed in the late 1950's and early 1960's as part of the United States Interstate Highway System. Roadway design standards have improved greatly since its initial design and construction. The current roadway exhibits design deficiencies including: inadequate shoulder and lane widths, inadequate ramp acceleration and deceleration distances, inadequate ramp length, inadequate ramp spacing to cross streets, inadequate bridge clearance and unofficial ramps. Additionally, the limited number of existing lanes does not meet the current traffic demands and result in severe congestion. This situation is likely to get worse with future growth and increasing traffic.

Existing Mobility on I-35E

The need for the proposed project is to address the transportation congestion of the area resulting from an increase in population and the subsequent increased travel demand. The proposed project, which traverses Dallas and Denton Counties, is an essential element in the local and regional transportation system. Within the region, I-35E functions as an interstate highway, serves as the primary north/south commuter corridor between Denton and Dallas, and also serves as a local route for trips to and from work, school, shopping, etc. As an important regional commuter route, I-35E connects the Cities of Dallas, Farmers Branch, Carrollton, Lewisville, Highland Village, Lake Dallas, Corinth, Town of Hickory Creek, and Denton as well as neighboring developing communities.

Proposed Mobility on I-35E

The purpose of the proposed project is to address the transportation needs on the corridor by increasing capacity, reducing traffic congestion, improving mobility, and improving roadway deficiencies within the DFW metropolitan area. The project will also serve to enhance the overall regional and national transportation system.

The proposed improvements for the project include widening the general purpose lanes (free main-lanes) and upgrading the interim concurrent HOV facility by adding a barrier separated bi-directional fully operational and accessible managed lane facility.

The proposed I-35E improvements include increasing the main-lane capacity by:

- Increasing the number of general purpose lanes from six to eight between I-635 and US 377
- Increasing the number of general purpose lanes from four to six between US 377 and I-35W
- Increasing the number of general purpose lanes from four to ten between I-35W and US 380
- Adding a barrier separated bi-directional managed lane facility
    - with four lanes from I-635 to US 77

    - with two lanes from US 77 to I-35W
    - with four lanes from I-35W to US 380
- Providing access to the barrier separated bi-directional managed lane facility at major traffic demand locations such as major intersections and major developed areas along the corridor
- Modifying access to the general purpose lanes to benefit main lane traffic by decreasing the amount of weaving interaction while maintaining accessibility and conforming to current design standards

The total overall construction cost is currently estimated at $4.0 billion. This total includes the cost of all construction activity to deliver the planned facility, environmental mitigation, right-of-way, utility relocation, and all associated planning, design, and engineering.

PROJECT ANALYSIS

The I-35E VE team analyzed the project using the VE tools and job plan.

Using function analysis, the team defined the highest order functions of this project as:

- *Increase Capacity*
- *Enhance Mobility*
- *Manage Peak Traffic*
- *Improve Air Quality*

Asking how we achieve these highest order functions listed above resulted in the identifying the key basic functions: *Improve Local Acces*s, *Upgrade/Meet Standards,* and *Accommodate Multimodal Options.* Analysis of the functions helped the team focus on the purpose and need of the project and consequently, determine how to craft alternative concepts that would provide the required functions.

In addition to the project functions, ten (10) specific performance criteria were developed in cooperation with the Project Development Team (PDT) and TxDOT. These performance criteria were ranked by weighting them using a paired comparison approach. The paired comparison method assessed the importance of each performance criteria in turn against all others to derive a total importance per criteria. From this assessment, the ranking was calculated. These criteria were used to evaluate ideas and alternative concepts. These criteria are identified later in this section under the heading Performance and Value Improvement.

Of the ten (10) performance criteria assessed, the PDT identified the following seven (7) performance criteria as essential to the success of the project:

- Revenue Impacts
- Environmental Impacts
- Stakeholder Acceptance
- Schedule Impact
- Traffic Operations- General Purpose Lanes
- Traffic Operations – Local
- Right of Way Impact

An analysis of the project cost estimates ranked, as a percentage of overall cost, all construction elements or categories which form part of the overall total project construction cost. This ranking identified the significant cost items and therefore, the *cost drivers* for the project. This ranking helped to guide the I-35E VE team in the development of ideas during the VE study.

The analysis revealed that approximately 80% of the construction cost will occur in approximately 20% of the project elements. For each segment, the rankings illustrate the following:

South Segment:

- The highest cost item, approximately 8% of the total construction cost is Mobilization which is related directly to the function *Initiate Construction.*

- The second highest cost item is Traffic Control, also representing 8% of the total cost and serving the function *Maintain Traffic, Protect Workers/Motorists.*

Middle Segment:

- The highest cost item, approximately 40% of the total construction cost, is Bridges (concrete over Lake Lewisville, both Managed and General Purpose Lanes) which is related directly to the functions *Carry Traffic* and *Span Water.*

- The second highest cost item is Mobilization, representing 8.5% of the total cost and serving the function of *Initiate Construction.*

North Segment:

- The highest cost item, approximately 9% of the total construction costs, is bridges (concrete, General Purpose Lanes) which are related directly to the functions *Carry Traffic, and Separate Grades*.

- The second highest cost item is Retaining Walls, representing 8.5% of the total construction costs, and serving the functions *Minimize ROW and Retain Earth*.

DEVELOPMENT OF VE ALTERNATIVES

A creative ideas session generated a list of potential ideas for the project. The ideas were separated into four (4) groups as follows:

- General/Phasing/Traffic Control = 60 ideas
- Middle Segment = 21 ideas
- South Segment = 14 ideas
- North Segment = 14 ideas

For each if these ideas, advantages and disadvantages were discussed and listed and the idea was ranked on a scale as follows:

- Rank 5 to 4 = Most likely to be developed
- Rank 3 = Design suggestion
- Rank 1 to 2 = Least likely to be developed
- WD = Withdrawn
- RQ = Required

There were 21 ideas that ranked 5 to 4 and these ideas were put forward for further consideration. The I-35E VE team was split into four groups and each group was assigned a number of the 21 ideas to assess and work out potential cost savings associated with each. Each item was described in a document including all relevant details, costs, advantages, and disadvantages. Each document was peer reviewed by all other members of the VE team and following these individual assessments, five VE alternatives were

accepted and three additional VA alternatives were conditionally accepted as being most realistic to develop. Please refer to "*VE Implementation Matrix*" immediately after this page.

Of the accepted alternatives, the VE team grouped these into two sets of alternatives to illustrate potential combinations that may be chosen for implementation. The alternatives included in the sets are those deemed by the team to represent the best value when considering the impact of the alternatives on project performance and cost savings.

Descriptions of *selected* VE alternatives are given below; summary lists and detailed documentation of all VE alternatives are in section 4 of this report.

Alternative Number	Description	Potential Savings *(Additional Cost)*	Performance
GENERAL/PHASING/TRAFFIC CONTROL			
1.0	**Defer new frontage road construction (where feasible)**	**$179,918,000**	**-1%**
	By deferring construction of the frontage roads (where feasible), the initial capital costs are reduced while the level of service on the GPs and MLs is not significantly impacted. The frontage road section being investigated, as proposed in the baseline case, provides frontage road continuity and a sidewalk for pedestrians. Without this section of frontage road, the managed lanes could be used for incident management. Also, because the quantity of bridges is being reduced, the cost of maintenance is reduced.		
2.0	**Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder**	**$159,000,000**	**+1%**
	An alternative to defer construction of the 4th GP lane construction in the south and middle segments to 2030 and 2040 have previously been evaluated by the Project Development Team. Traffic and revenue analysis indicates that managed lane toll revenue could potentially increase by not implementing the 4th GP lane. Cost savings for these alternatives were estimated at approximately $17 and $45 million respectively for the south and middle segments. These cost savings assumed retaining walls and bridge structures were unchanged from the base project but did reduce excavation and embankment quantities as well as other incidental quantities which were not included in this analysis. The total savings of $159M includes the cost savings in construction plus the additional revenue generated in the managed lanes due to reduced capacity on the general purpose lanes.		
4.0	**Early implementation of HOT lanes (convert existing HOV to HOT) – allowed under current legislation**	**$9,000,000**	**+3%**
	Early implementation of HOT lanes helps to generate early revenue to support construction of the full project. The current HOV lane is under-utilized during the peak hours. Converting the HOV lanes to HOT lanes will relieve traffic congestion and generate revenue before completion of construction of the full project scope.		
5.2	**Defer ROW acquisition and construction of the northern part of Middle Segment and the complete North Segment (defer from Valley Ridge Blvd. north)**	**$1,800 million**	**+6%**

Alternative Number	Description	Potential Savings *(Additional Cost)*	Performance
	This VE alternative proposes to reduce the project scope to be in line with funding available today, including potential revenue generated by traffic. When additional funding is available, the remaining part of the Middle segment and all of the North section can be developed in 2040. This alternative will potentially make a more financially viable project to begin construction in 2011. This alternative proposes to construct and acquire ROW only for the south segment and part of the middle segment, i.e. construction 12 miles out of the total 28 miles and construction the remainder in 2040.		
6.0	**Construct elevated Managed Lanes or Managed Lanes on outside, defer construction of General Purpose lanes**	**$408,000,000**	**-2%**
	The primary justification for constructing elevated managed lanes and deferring the reconstruction of general purpose, frontage roads, and cross streets allows for an early revenue stream while adding capacity and reducing the ultimate ROW requirements. Cost of project to achieve managed lanes is reduced from $4B to $1B. Because the elevated structures can be constructed with minimal impact to the existing facility and the construction duration is significantly reduced, the revenue stream from the managed lanes can be collected sooner than in the baseline case. Additionally, because the capacity of the general purpose lanes is not increased until the general purpose lanes, frontage roads, and cross streets are constructed at a later date (deferred), and because the volume of traffic is expected to increase over time, it can be assumed that more traffic will use the managed lanes therefore reducing the ramp-up period on the managed lanes bringing in more revenue sooner.		
MIDDLE SEGMENT			
13.0	**Shorten Bridge (over water) length**	**$170,251,000**	**+8%**
	The highway, in its current configuration, is built on fill with a single bridge opening (1000' span) over Lake Lewisville. The current proposed concept calls for a 9100' bridge spanning the entire lake. The reason for this is the avoidance of mitigation for additional fill to be placed in the lake as required by the US Army Corps of Engineers (COE). This alternative concept will require additional coordination with the COE to find a suitable location to mitigate the loss of lake capacity. Assuming mitigation is feasible, the concept will result in substantial savings in construction cost and construction schedule.		
SOUTH SEGMENT			
15.0	**Extend frontage road (auxiliary lanes) from ramp to ramp instead of ramp to cross street**	**$1,164,000**	**-8%**
	There are several areas in the south segment that may benefit from a reduction in the number of frontage lanes without jeopardizing access to businesses and the highway. Removing a 12' frontage road from ramp to cross-street reduces the upfront cost of the project along with a savings in future maintenance work.		
NORTH SEGMENT			

Alternative Number	Description	Potential Savings *(Additional Cost)*	Performance
16.0	**Allow purchase ROW (by individual parcel or selected) but defer construction of North Segment**	**$846,297,000**	**-6%**
	Currently, there is a significant funding gap to construct the proposed ultimate I-35E corridor improvements. In addition, traffic and revenue studies indicate that construction of the ultimate improvements in the North Segment generate a smaller amount of revenue compared to the South and Middle Segments. The North Segment is, therefore, the least attractive segment within the I-35E Corridor as part of any potential investment. Due to this limited funding and lower revenue potential, the alternative considers the deferral of construction of the North segment until funding becomes available. However, once environmental clearance has been obtained, the ROW acquisition could still begin as the first stage of project development. The $425M cost for acquisition of the ROW in the North segment will be about 33% of the total North segment costs. At least $663M in construction costs will be deferred. The remaining $183M in utility relocation and engineering could also be deferred for a total deferral of $846M. This is 67% of the total North segment construction cost of $1,271M.		
17.0	**Flip the connection at US 77 with I-35E at grade**	**$15,329,000**	**-1%**
	Flipping the connection between US 77 and I-35E has the potential to reduce quantities and costs for retaining walls, pavement, and structures. In addition to flipping this interchange, reconfiguration of the connection between the managed lanes was considered. Both ramps from US 77 were relocated to merge into the center of the managed lanes on I-35E. This would reduce construction costs by keeping these two facilities on the same structure. The SB US 77 to I-35E general purpose lanes and the SB US 77 to I-35E frontage road ramps were also merged into a two lane ramp to the I-35E frontage road. An entrance ramp was then added to the south from the I-35E frontage road to the I-35E general purpose lane. Relocating this entrance ramp to connect to the frontage road then allowed removing the entrance ramp approximately 1,000 feet to the north (part of the existing braided ramp configuration). Flipping the interchange presented in this concept would also eliminate the San Jacinto crossing of I-35E.		

VALUE ENGINEERING STUDY SUMMARY REPORT

INTRODUCTION

The Value Engineering Summary Report (VESSR) is filled out portion-by-portion as the VE Study progresses, and it is submitted as part of the Final VE Study Report.

The VESSR includes:

VESSR – Participants and Schedule: This page identifies the VE team and other key participants involved in the VE Study. The schedule of key events is also listed on this page.

VESSR – Proposed Alternatives: All VE alternatives are listed with their potential cost and performance changes. The VE team establishes sets of selected VE alternatives to provide reviewers guidance and added understanding of how the alternatives can fit together into a solution for the project. The sets and their cost, performance, and value changes are listed on this page. Cost savings and cost increases are totaled separately.

VESSR – Accepted Alternatives: Accepted VE alternatives are listed with their validated cost and performance changes. The total impact of the accepted VE alternatives is determined and the cost, performance, and value changes are listed on this page. Note: The total cost or performance changes are not necessarily the sum of the accepted VE alternatives, as there may be overlapping or synergistic effects of combining certain VE alternatives. Cost savings and cost increases are totaled separately.

VESSR – Conditionally Accepted Alternatives: If, after the Implementation Meeting, there are conditionally accepted VE alternatives, they are listed on this page and their information is summarized similar to the accepted VE alternatives.

VA PARTICIPANTS AND SCHEDULE

The six-day study was performed during the period of August 16-18, 23-25, 2010, at TxDOT-Dallas District conference room, located in Mesquite, Texas. The VE study was led by Martin Hsu, PE, CVS-Life, from *Martin Y. Hsu, PE, CVS & Associates, Inc.* The VE team members are listed below:

Name	Function/Position	Organization
Bowen, Doug	Roadway Design	Jacobs
Chan, Eva	Civil Engineer/O&M	Halcrow
Chapman, Dan	Civil Engineer	HNTB
Craig, Matt	PM-Schematic/EA	Halff Associates, Inc.
Daily, Kimberly	Project Manager	Jacobs
Drayton, Michael	Finance/Revenue	KPMG
Frye, James	Landscape Architect	HNTB
Gardiner, Chad	Project Engineer	Halff Associates, Inc.
Graff, Joe	Civil Engineer	Halcrow
Hammons, Tom	Transportation Engineer	City of Carrollton
Irani, Spenta	Transportation Engineer	Jacobs
Ji, Jerry	T&R	Wilbur Smith Associates
Kerrigan, Michael	Sr. Consultant	Halcrow
McGahan, Jeremy	Project Engineer	Halff Associates, Inc.
Nguyen, John	CDA	TxDOT
Reichert, Bill	CDA Program Specialist	TxDOT
Riou, Charles	Design/Transportation	TxDOT
Taylor, Mark	Civil Engineer	Halcrow
Ullman, Phil	Project Manager	HDR
Vasquez, Lucio	CDA Program Specialist	TxDOT
Walters, Shane	Project Engineer	HDR
Martin Hsu	Team Leader	Martin Y. Hsu, PE, CVS & Associates, Inc.

The VE team was supported by several members of the TxDOT project development team and other stakeholders throughout the VE session. These participants included:

Name	Function/Position	Organization
Brown, Bob	CDA Manager	TxDOT
MacGregor, Matt	CDA Project Manager, MDP	TxDOT
Askari, Nasser		TxDOT
Murphy, James		Army Corps of Engineers

VE ALTERNATIVES

INTRODUCTION

The results of this study are presented as individual alternatives to the original concept.

VE ALTERNATIVES

Each alternative consists of a summary of the original concept, a description of the suggested change, a cost comparison, change in performance, a listing of its advantages and disadvantages, and a brief narrative comparing the original design with the alternative. Sketches, calculations, and benefits are also presented.

Performance measures are calculated by rating on a scale 1 to 10, the overall project against each of the weighted criteria to arrive at a total score (rating times weight, and totals for all criteria added together). The difference between the score for the project with that VE alternative incorporated and the score for the project baseline concept, is expressed as a percentage.

The cost comparisons reflect the comparable level of detail as in the original estimate. A life cycle benefit-cost analysis for major alternatives is included where appropriate.

ALTERNATIVE SETS

VE sets are established by the VE team as their "best value" solution, based on improved performance, likelihood of implementation, improvements to the local and mainline operations, capacity improvements, cost savings, or any combination of criteria. A VE set may contain one or more alternatives and each set is typically mutually exclusive of other sets (i.e., implementing VE Set 1 precludes implementation of VE Set 2). VE sets are selected alternatives combined from mutually exclusive groups that can compete in whole or in part against the original design concept. This requires an additional performance rating and totaling of costs for the sets.

The VE team developed two sets of alternatives to illustrate potential combinations that may be chosen for implementation. The alternatives included in the sets are those deemed by the team to represent the best value when considering the impact of the alternatives on project performance.

SUMMARY OF VE ALTERNATIVES				TxDOT	
Alt. No.	**Description**	**Potential Savings**	**Potential Performance Improvement**	**Validated Cost Savings Initial**	**Validated Performance Improvement**
GENERAL/PHASING/TRAFFIC CONTROL					
1.0	Defer new frontage road construction (where feasible)	$179,918,000	-1%		
2.0	Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder	$159,000,000	+1%		
3.0	Defer wishbones and use slip ramps instead (where applicable)	$76,872,000	-2%		
4.0	Early implementation of HOT lanes (convert existing HOV to HOT) – allowed under current legislation	$9,000,000	+3%		
5.1	Defer ROW acquisition and construction of northern part of Middle Segment and North Segment (defer Garden Ridge north)	$1,523 million	+4%		
5.2	Defer ROW acquisition and construction of northern part of Middle Segment and North Segment (defer Valley Ridge north)	$1,800 million	+6%		
6.0	Construct elevated Managed Lanes or Managed Lanes on outside, defer construction of General Purpose lanes	$408,000,000	-2%		
7.0	Interim Managed Lanes in the median south of US 77 to north of FM 2181 (Swisher Rd) – defer the ultimate construction	$18,546,400	+8%		
8.0	Optimize pavement design alternatives (baseline is perpetual – 48" for ramps, CD, GP, ML and 36" for frontage road)	Additional Initial Cost: ($82,619,000) O&M Savings: $665,000,000 Total LCC: $582,346,000	-4%		

SUMMARY OF VE ALTERNATIVES				TxDOT	
Alt. No.	**Description**	**Potential Savings**	**Potential Performance Improvement**	**Validated Cost Savings Initial**	**Validated Performance Improvement**
9.0	5-year maintenance contract post construction completion, 15-year CMA post construction completion	Deferred savings: $401million	+2%		
MIDDLE SEGMENT					
10.0	Revise wishbone design (instead of going over, go under)	30,000,000	+8%		
11.0	Combine GP and CD lanes (7 lanes total) between PGBT and SH121	$22,000,000	+0%		
12.0	Construct Corporate, FM 407, Country Lane/S Denton, Turbeville, over I-35E	$26,994,401	-2%		
13.0	Shorten Bridge (over water) length	$170,251,000	+8%		
14.0	Eliminate frontage roads over Lake	$179,416,000	-5%		
SOUTH SEGMENT					
15.0	Extend frontage road (auxiliary lanes) from ramp to ramp instead of ramp to cross street	$1,164,000	-8%		
NORTH SEGMENT					
16.0	Allow purchase ROW (by individual parcel or selected) but defer construction of North Segment	$846,297,000	-6%		
17.0	Flip the connection at US 77 with IH 35E at grade	$15,329,000	-1%		
18.0	Combine exit ramps from US 77 to IH 35E, relocate braided ramp to south	$1,378,000	-2%		
19.0	Push NB General Purpose lanes out at I-35W to eliminate one bridge	$3,270,000	-10%		

Note: Alts. 5.1 & 5.2 exclude all North Segment alternatives
Alts. 13.0 and 14.0 are mutually exclusive

SUMMARY OF VE DESIGN SUGGESTIONS	
Idea No.	**Description**
GENERAL/PHASING/TRAFFIC CONTROL	
P-9	Use rigid pavement
P-9a	Allow precast pavement options
P-10	Use alternative materials for bridges (fiber reinforced polymers)
P-11	Maximize use of standard spans on bridges (geometric adjustments)
P-18	Evaluate typical section to use more of existing profile (ML can have reverse cross slopes)
P-22	Eliminate barriers in sections where possible
P-26	Stagger gores to minimize structure/ROW
P-29	Lock developer into fixed price at earliest stage possible
P-31	Incentivize developer for accelerated delivery
P-32	Minimize green space between roadways (GPs and frontage road) – squeeze ROW
P-33	Sell naming rights for key structures and retaining walls
P-34	Incorporate themes into the aesthetics
P-36	Ask Oklahoma Casinos for contribution
P-40	Study linear need for sidewalks and add if warranted
P-41	Special enhancements to pedestrian/bicycle facilities near transit facilities
P-42	Eliminate free right turns at signalized intersections

SUMMARY OF VE DESIGN SUGGESTIONS	
Idea No.	**Description**
P-43	Provide protected refuge areas in median at crossings
P-44	14’ outside lanes or bike lanes (coordinate with local bike groups) exclusive of offset, curb and gutter
P-45	Seek funding from connecting facilities (635 and SH121 and PGBT)
P-47	Evaluate alternatives to drilled shaft walls/wall systems
P-48	Re-evaluate mobilization and traffic control percentages
P-49	Re-evaluate unit prices
P-50	Investigate incentives for low emission vehicles
P-52	Utilize more existing pavement
P-54	Review ROW, identify properties that could be saved
P-55	Sharing of costs for tolling with NTTA
P-56	Use movable barriers during construction to encourage ease of construction, safety, etc and to maximize lane flow
P-57	Use of movable barrier in terms of permanent ML applications
P-59	Optimize geometrics to reduce ROW acquisitions
P-60	Utilize more of existing pavement – bring to the center, convert to ML and add GP to the outside using existing shoulder
MIDDLE SEGMENT	
M-15	Reduce frontage road total lanes from 3 to 2 and/or 4 to 2
M-19	Access recreational area via old embankment off of Garden Ridge to eliminate new RR crossing

SUMMARY OF VE DESIGN SUGGESTIONS	
Idea No.	**Description**
M-20	Parking for recreation area could be under highway structure and route trail under existing roadway and rail bridges along shoreline
M-17	Sell naming rights to Lewisville Lake bridge
M-21	Reduce water crossing structures by working with COE to reduce floodway width and marsh areas/wetlands (streams)
SOUTH SEGMENT	
S-11	Find usage for water being pumped for example irrigation or water feature
S-14	Optimize connections to 635 MLs and 35E MLs to enhance revenue generation
NORTH SEGMENT	
N-9	Make cross streets come in at 90 degrees where possible
N-12	Confirm capacity and functionality of pedestrian bridge, make it expandable? Two smaller bridges?
N-14	Investigate ROW minimizing since traffic volumes are lower

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	**TxDOT/TTA**	
FUNCTION: Access Freeway/Properties	**IDEA NO.** P-3	**ALTERNATIVE NO.** 1.0
TITLE: Defer new frontage road construction (where feasible)		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The baseline assumes that new frontage roads will be constructed where none exist today. For example, this is the area across the Lake Lewisville.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

This alternative concept assumes that new frontage road construction will be deferred to 2030 unless operations require a new frontage road to be constructed. This alternative assumes a frontage road will not be built across Lake Lewisville.

ADVANTAGES:

- Saves upfront cost (majority of bridges, most of the bridges over Lake Lewisville)
- Reduces maintenance costs
- Reduces columns in the flood storage area
- Uses of more of existing structure (bridge over lake)
- Defers impact to COE recreation area.

DISADVANTAGES:

- Affects access to COE recreation area. (Would change mitigation and access plan.)
- Limited application
- May increase cost to construct later
- Incident management flexibility is reduced.

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	$ 321,334,000	$ 0	$ 321,334,000
Alternative Concept	$ 141,416,000	$ 0	$ 141,416,000
Savings	$ 179,918,000	$ 0	$ 179,918,000

Team Member:	Spenta Irani, Charles Riou, Bill Reichert, Kim Daily	**Discipline:**	Design Design TTA Assistant	**PERFORMANCE:** **-1%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	TxDOT/TTA	
TITLE: Defer new frontage road construction (where feasible)	**ALTERNATIVE NO.** 1.0 (P-3)	**PAGE NO** 2 of 7

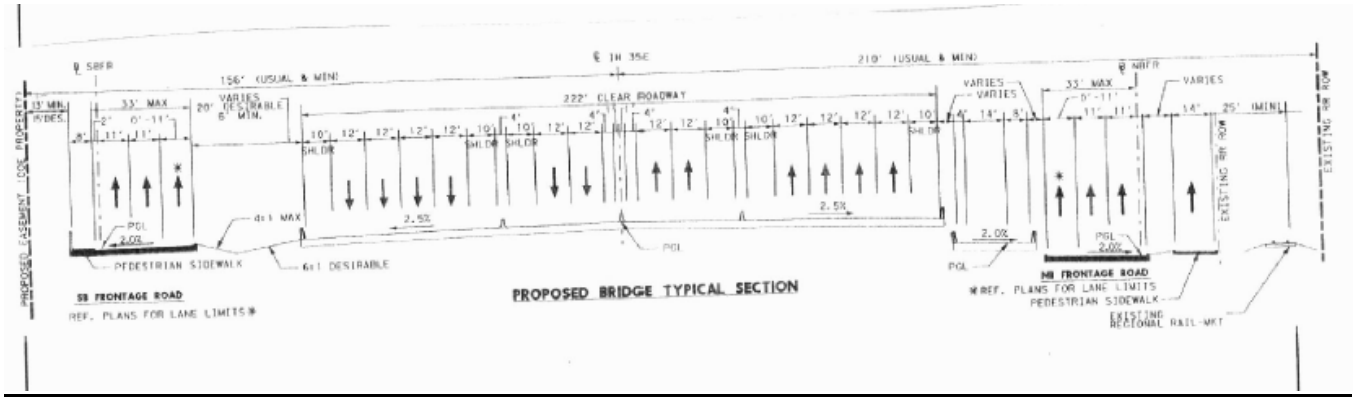
DISCUSSION / JUSTIFICATION:

By deferring construction of the frontage roads where feasible, the initial capital costs are reduced while the level of service on the GPs and MLs are not significantly impacted. The frontage road section being investigated, in the baseline case, provides frontage road continuity and a sidewalk for pedestrians.

The managed lanes could be used for incident management.

Because the quantity of bridges is being reduced, the cost of maintenance is reduced.

Original Design



PROPOSED BRIDGE TYPICAL SECTION

Proposed Alternative

Total Performance:		589	584
Net Change in Performance (%):			-1%

Assuming can use the existing bridge over Lake Lewisville for some of the NB GP lanes and NB ML plus pedestrian walkway. (Interim condition will have 3 GP lanes (no pedestrian walkway) in each direction due to constructability of using the existing structure. The ultimate will accommodate pedestrians in the same manner as the baseline.)

Assume that COE recreation area mitigation will be deferred with deferral of FR.

Assume existing bridge has at least 20 years usable life left. (Assumed in baseline as well.)

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
FUNCTION:	Reduce Upfront Construction Cost/Enhance Revenue	**IDEA NO.** P-5	**ALTERNATIVE NO.** 2.0
TITLE:	Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder.		**PAGE NO.** 1 of 6

ORIGINAL CONCEPT: Construct four General Purpose (GP) lanes from north of IH 635 to US 77 (excluding the section between the PGBT and SH 121 interchanges) with 10-ft. shoulders.

ALTERNATIVE CONCEPT: Construct three GP lanes from north of IH 635 to US 77 with a 10-ft. inside shoulder and 12-ft. outside shoulder. The 12-ft. outside shoulder will ONLY be utilized as a traffic lane for peak periods when appropriate so as to not reduce Managed Lane (ML) revenue potential during off-peak periods.

ADVANTAGES:

- Reduces upfront construction costs
- Enhances revenue potential
- Provides flexibility for 4th lane capacity during peak periods by utilizing the outside shoulder (assuming FHWA concurrence).
- May increase deferral duration for 4th lane construction beyond other scenarios under evaluation because of the potential use of the 12 ft. as a travel lane during peak periods.

DISADVANTAGES:

- Impacts regional transportation plan and air quality plan
- More expensive to construct future 4th lane
- May reduce LOS and impact IAJR
- Ramp gore locations will be impacted which may impact IAJR
- Additional cost for signage/ITS
- Increased incident impacts during peak construction
- Potential political sensitivity if 4th lane not constructed as base project

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder.	**ALTERNATIVE NO.** 2.0 (P-5)	**PAGE NO** 2 of 6

DISCUSSION / JUSTIFICATION:

Alternatives to defer 4th lane construction for the south and middle segments to 2030 and 2040 have already been evaluated during cost savings and revenue enhancement efforts performed after the level 2 traffic and toll revenue study. This effort showed that managed lane toll revenue could increase by not implementing the 4th lane. Cost savings for these alternatives were estimated at approximately $17 and $45 million respectively for the south and middle segments. These cost savings assumed retaining walls and bridge structures were unchanged from the base project but did reduce excavation and embankment quantities as well as other incidental quantities which were not included in this analysis.

The objective of this alternative is to further reduce upfront construction costs by eliminating the outside 10 foot of the general purpose lane bridge structures. The paving limits will be reduced by 10 ft. so that a 12 ft. wide outside shoulder is initially constructed to facilitate future utilization as a traffic lane during peak periods. The objective of providing this flexibility is to potentially delay construction of the 4th lane beyond the 2030 or 2040 scenarios already evaluated and to potentially further enhance managed lane revenue.

Delaying the 4th lane would be accomplished by eliminating either the 10 ft. wide inside or outside shoulder for the general purpose lanes included in the base project. Eliminating the inside shoulder would provide flexibility for potentially constructing a future 3rd managed lane in lieu of a 4th general purpose lane. The inside shoulder would only have to accommodate 7 slip ramp connections for the interim condition while the outside shoulder would have to accommodate 76 ramp connections. However, with the objective of further reducing upfront construction cost by reducing the general purpose bridge width initially constructed, the inside shoulder is unlikely a viable alternative. A bridge rail on the inside shoulder would be required for the interim condition. This would reduce the bridge width savings from 10 ft. to 9 ft. Leaving a 9 ft. wide gap between the managed lane bridge deck and general purpose lane bridge deck to be completed in the future is simply impracticable. The gap between the managed lanes and general purpose lanes would likely have a significant impact on traffic control.

Consequently, the alternative developed for this analysis assumes the base project outside 10 ft. shoulder is eliminated and the 4th outside general purpose lane becomes a 12 ft. wide outside shoulder. The outside shoulder accommodates an 11 ft. wide travel lane (which would require FHWA approval) with a one foot offset to edge of pavement and bridge rail for peak period operation as appropriate.

PERFORMANCE *I-35E Managed Lanes Project*	**TxDOT/TTA**		
TITLE: Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder	**NUMBER** 2.0 (P-5)		**PAGE NO.** 3 of 6
CRITERIA	**Performance**	**Original**	**Alternative**
REVENUE IMPACTS: Based on T&R studies, deferring the 4th lane increases revenue potential. Assume adding a third ML in lieu of a 4th GP lane represents maximum potential so a value between based project and maximum is selected.	Measure	Degree	Degree
	Rating	6	8
	Weight	18	18
	Contribution	108	144
TRAFFIC OPS - GENERAL PURPOSE LANES: 4th lane capacity is provided for peak hour periods by utilizing the 12 ft. GP outside shoulder. This will not perform as efficiently as the full 4-lane section	Measure	Degree	Degree

CALCULATIONS/ASSUMPTIONS *I-35E Managed Lanes Project*		TxDOT/TTA
TITLE: Defer 4th General Purpose Lane and Provide 12 ft. Outside Shoulder.	**NUMBER** 2.0 (P-5)	**PAGE NO.** 4 of 6

Assumptions:

- Retaining walls and excavation quantities are unchanged from the base project (embankment, top soil and seeding are increased to account for reduced general purpose lane paving section.
- Frontage road and ROW limits are unchanged from base project.
- Drainage structures and systems are not appreciably impacted.
- 400 ft. of general purpose pavement assumed to facilitate each ramp connection between frontage road and general purpose lanes.
- Additional embankment, signing, prime coat, and additional bridge approach guard rail are included in contingency. Reduction in pavement marking is not included to offset above.
- Do not include bridge over Lake Lewisville in bridge reduction calculation because of the need for storm water filtering and because the frontage road bridge deck is adjacent to general purpose lane bridge deck. Reconsider this assumption if frontage roads are eliminated from Lake Lewisville crossing.

Calculations:

- From attached Bridge_Paving spreadsheet, length of paving is 216,770 LF, length of bridge is 28,538 LF
- Reduction in paving length for ramp connections = 400 LF x 76 = 30,400 LF
- Total area of Pavement eliminated = ((216,770 – 30,400) x 10 LF)/9 = 207,078 SY
  - CEMENT TRT(34") (General Purpose) = 207,078 x 1.05 = 217,432 SY
  - CEMENT (General Purpose) = ((217,432 x 9 x 120 x 34/12)/2000) x .03 = 9,980 TONS
  - BASE COURSE (6.5") (SP-B) (General Purpose) = (6.5 x 110 x 207,078)/2000 = 74,030 TONS
  - BASE COURSE (4") (SP-D) (Gen Purpose) = (4 x 110 x 207,078)/2000 = 45,557 TONS
  - SURFACE COURSE (1.5") (PFC) (Gen Purpose) = (1.5 x 95 x 207,078)/2000 = 14,754 TONS
  - SURFACE COURSE (2") (SMA-D) (Gen Purpose) = (2 x 110 x 207,078)/2000 = 22,779 TONS
- Total area of Bridge Deck eliminated = 28,538 LF x 10 LF = 285,380 SF
- Earthwork Quantities (Reduces savings):
  - COMPOST MANUF TOPSOIL (BOS)(4") = (207,078 SY)
  - BROADCAST SEED (PERM) (URBAN) (CLAY) = (207,078 SY)
- Estimated present value increase in manage lane revenue realized by deferring the 4th lane construction to 2030 based on the Level 2 T&R study is $119 million.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: General/Phasing/Traffic Control	**IDEA NO.** P-7	**ALTERNATIVE NO.** 3.0
TITLE: Defer wishbones and use slip ramps instead (where applicable)		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The baseline assumes that in certain places, wishbone ramps are used to carry traffic from the managed lanes to cross streets and vice versa instead of forcing managed lane traffic out of the managed lanes to cross over the GP lanes to access cross streets and exits.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

This alternative concept assumes that access to cross streets and exits is available to managed lane traffic via slip ramps out of the managed lanes into the general purpose lane exits.

ADVANTAGES:

- Reduces upfront costs
- Simplifies construction and traffic control
- ML access flexibility
- Slip ramp allows for widening of MLs in the future

DISADVANTAGES:

- May be more to construct later
- Reduces future flexibility
- IAJR impacted
- Makes ML less attractive to users depending on location
- Adds to weaving across GP lanes

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 80,500,000	**$** 0	**$** 80,500,000
Alternative Concept	**$** 3,6287,000	**$** 0	**$** 3,6287,000
Savings	**$** 76,873,000	**$** 0	**$** 76,873,000

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer wishbones and use slip ramps instead (where applicable)	**ALTERNATIVE NO.** 3.0 (P-7)	**PAGE NO** 2 of 7

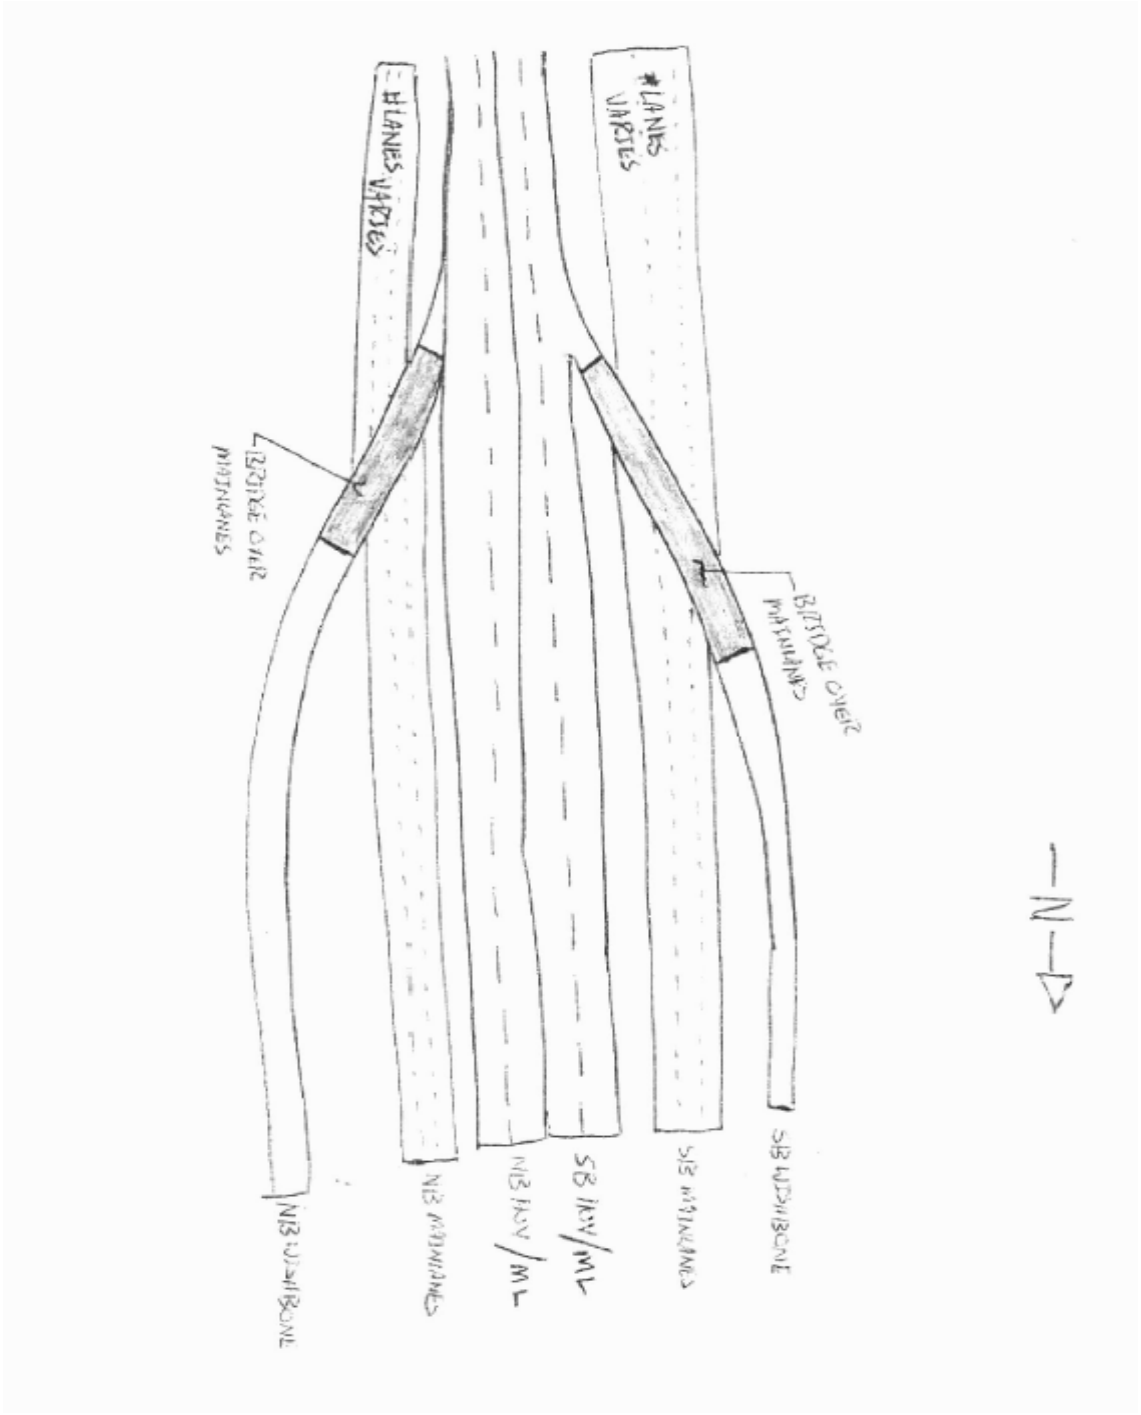
DISCUSSION / JUSTIFICATION:

One of the most expensive elements of the project is the construction of wishbones ramps which are also complicated to build over active traffic.

Wishbones do not allow flexibility for future access to ML. Slip ramps would allow future widening of the MLs.

Reduction in cost is a benefit.

Original Design



Proposed Alternative

CALCULATIONS/ASSUMPTIONS *I-35E Managed Lanes Project*		TxDOT/TTA
TITLE: Defer wishbones and use slip ramps instead (where applicable)	**NUMBER** 3.0 (P-7)	**PAGE NO.** 6 of 7

Assumes that all wishbone locations can be changed to a slip ramp.

Assumes that space required for baseline wishbones allows space for slip ramps.

Assume cost for wishbone ramp based on designer calcs, same cost number used in VE Alt 10.0 (M-10).

Assumed 1000’ is sufficient for slip ramp.

Assume minimal revenue impacts.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
FUNCTION:	Early Revenue Generation	**IDEA NO.** P12/S12	**ALTERNATIVE NO.** 4.0
TITLE:	Early implementation of HOT lanes (convert existing HOV to HOT) for section between IH635 and SH121 – allowed under current legislation		**PAGE NO.** 1 of 5

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Completion of Managed Lanes (HOT lanes) for the full project scope and commencement of toll revenue collection by 2017.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Convert the existing HOV lane to a HOT lane in each direction for the section between IH635 and SH121 (about 7 miles) and collect toll revenue before the completion of the full project scope in 2017. The HOT lanes will be operated for 6 years (between 2011 and 2016).

ADVANTAGES:

- Early revenue generation
- Relief congestion during peak hour (before project completion)
- Make good use of road space (currently the HOV lane is under utilized)
- Easy to implement
- Could be very marketable during construction

DISADVANTAGES:

- Difficult enforcement because no concrete barriers can be placed (due to space constraints)
- Duplicate toll equipment installation costs
- Creates constructability issues when ultimate construction begins
- Weaving problems from IH635 to SH121

COST SUMMARY	Initial Cost	Present Value for subsequent operation cost ("-"for income)	Net Present Value
Original Concept	**$** 17m	**$** 0m	**$** 17m
Alternative Concept	**$** 17m	**$** -9m	**$** 8m
Savings	**$** 0m	**$** 9m	**$** 9m

Team Member:	Michael Kerrigan Eva Chan Dan Chapman	**Discipline:**	Civil Engineer Civil Engineer Civil Engineer	**PERFORMANCE:**	**+3%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Early implementation of HOT lanes (convert existing HOV to HOT) for section between IH635 and SH121 – allowed under current legislation	**ALTERNATIVE NO.** 4.0 (P-12/S-12)	**PAGE NO** 2 of 5

DISCUSSION / JUSTIFICATION:

Early implementation of HOT lanes helps to generate early revenue to support construction of the full project. The current HOV lane is under-utilized during the peak hours. Converting the HOV lanes to HOT lanes will relieve traffic congestion and generate revenue before completion of construction of the full project scope.

PERFORMANCE *I-35E Managed Lanes Project*		**TxDOT/TTA**	
TITLE: Early implementation of HOT lanes (convert existing HOV to HOT) for section between IH635 and SH121 – allowed under current legislation		**NUMBER** 4.0 (P-12)	**PAGE NO.** 3 of 5

	Measure	Degree	Degree
	Rating		
	Weight		
	Contribution	0	0
Total Performance:		589	607
Net Change in Performance (%):			3%

Cost Assumptions:

- Annual toll operation cost- $2.2m
- Total toll operation cost for 6 years = 6* 2.2m = $13.2m
- Since toll equipment will only be used for 6 years, the maintenance cost (especially Capex) is assumed to be minimal
- Total HOT lane operating cost for 6 years = $13.2m
- It is assumed that the Capital cost of the Toll Collection Equipment ($17m) is cancelled out in this calculation as it will form part of the baseline construction cost and is therefore carried in to the full scope project cost.

Revenue Assumptions:

- Revenue income for HOT lane operation between 2011 and 2016 is estimated to be $22.2m.

Year	HOT lane revenue ($m)
2011	2.8
2012	3.3
2013	3.8
2014	4.0
2015	4.1
2016	4.3
Total	22.2

- In 2010 $, early implementation of the HOT lanes contributes a surplus of $22.2m - $13.2m = $9m

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**	
FUNCTION:	Defer construction and ROW acquisition	**IDEA NO.** P-13	**ALTERNATIVE NO.** 5.1
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Garden Ridge North)		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Acquire ROW at the start of construction of the project and build the project to full scope (i.e. 28 miles)

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Only construct the project from the South up to Garden Ridge Blvd in the Middle segment (south of the lake, STA 1360+00) and acquire the corresponding ROW in order to save upfront construction costs. Defer ROW acquisition and road construction North of Garden Ridge Blvd (North segment + north of Middle segment) to year 2040.

ADVANTAGES:

- Reduces upfront cost significantly
- Defers cost of mitigation to COE property
- Defers maintenance costs
- Moves towards a more financially viable project

DISADVANTAGES:

- Creates hardship for current owners (urban blight)
- May cost more later to acquire ROW and to construct
- Doesn't help reduce today's congestion
- reduces revenue for middle section
- Unable to relocate utilities
- Defers development in north along corridor
- Reduces LOS north of Lake
- Reduces alternate routes for incident management

COST SUMMARY	Initial Cost	Present Value of Toll Revenue (-ve as income)	Net Present Value
Original Concept	**$** 4,003 million	**$** -764 million	**$** 3,239 million
Alternative Concept	**$** 2,151 million	**$** -435 million	**$** 1,716 million
Savings	**$** 1,852 million	**$** - 329 million	**$** 1,523 million

Team Member:	Michael Kerrigan Eva Chan Dan Chapman	**Discipline:**	Civil Engineer Civil Engineer Civil Engineer	**PERFORMANCE:** **+4%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Garden Ridge Blvd North)	**ALTERNATIVE NO.** 5.1 (P-13-1)	**PAGE NO** 2 of 7

DISCUSSION / JUSTIFICATION:

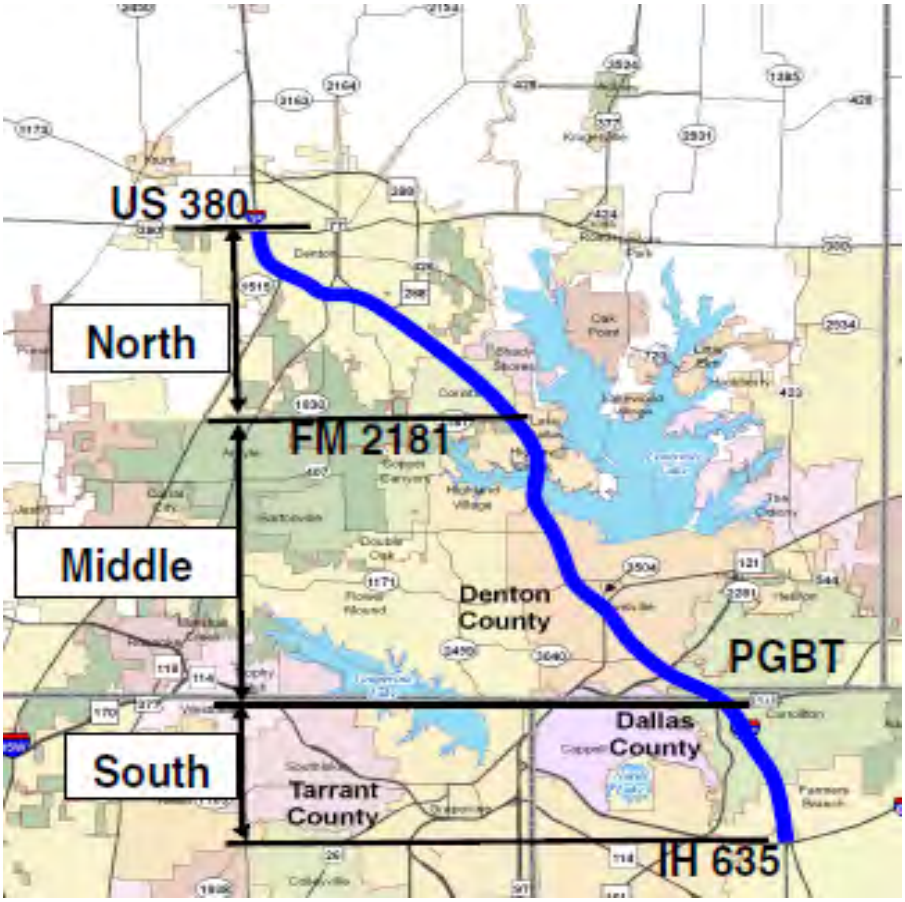
To reduce the scope to be in line with funding available today, including potential revenue generated by traffic. When extra funding is available, the remaining part of the Middle segment and all of the North section will be developed in 2040.

This alternative will potentially make a more financially viable project to begin construction in 2011.

SKETCHES *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Garden Ridge North)	**NUMBER** 5.1 (P-13-1)	**PAGE NO.** 3 of 7

Original Design

Construction of complete project (28 miles)



Proposed Alternative

Only acquire ROW and construction of the project up to Garden Ridge Blvd (14 miles)

Total Performance:		589	610
Net Change in Performance (%):			4%

Cost Assumptions:

- Middle section after Garden Ridge Blvd to FM2181: deferred cost saving is $581m, including ROW acquisition cost, utility, engineering cost, PS&E, construction saving. There is an additional pavement transition cost of $15m. See spreadsheet attached for revenue projection.
- North section: deferred cost saving is $1.271 billion
- Total upfront construction cost deferred is **$1.852 billion**
- The Construction costs and savings are summarized in the table below:

	Original Concept Costs ($m)	Proposed Alternative Costs ($m)	Upfront Cost Savings ($m)
North Section	1271	0	1271
Middle Section	1901	1320	581
South Section	831	831	0
Total	**4,003**	**2,151**	**1,852**

Revenue Assumptions:

- Reduction in present value toll revenue if the construction of the road segment is deferred to 2040: $329m
- Total present value deferred cost saving to 2040 = $1852m - $329m = **$1523m**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**	
FUNCTION:	Defer construction and ROW acquisition	**IDEA NO.** P-13-2	**ALTERNATIVE NO.** 5.2
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Valley Ridge North)		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Acquire ROW at the start of construction of the project and build the project to full scope (i.e. 28 miles)

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Only construct the project from the South up to Valley Ridge Blvd in the Middle segment (further south of the lake, STA 1260+00) and acquire the corresponding ROW in order to save upfront construction costs. Defer ROW acquisition and road construction North of Valley Ridge Blvd (North segment + north of Middle segment) to year 2040.

ADVANTAGES:

- Reduces upfront cost significantly
- Defers cost of mitigation to COE property
- Defers maintenance costs
- Moves towards a more financially viable project

DISADVANTAGES:

- Creates hardship for current owners (urban blight)
- May cost more later to acquire ROW and to construct
- Doesn't help reduce today's congestion
- Reduces revenue for middle section
- Unable to relocate utilities
- Defers development in north along corridor
- Reduces LOS north of Lake
- Reduces alternate routes for incident management

COST SUMMARY	Initial Cost	Present Value of Toll Revenue (-ve as income)	Net Present Value
Original Concept	**$** 4,003 million	**$** -764 million	**$** 3,239 million
Alternative Concept	**$** 1,787 million	**$** -384 million	**$** 1,403 million
Savings	**$** 2,216 million	**$** -416 million	**$** 1,800 million

Team Member:	Michael Kerrigan Eva Chan Dan Chapman	**Discipline:**	Civil Engineer Civil Engineer Civil Engineer	**PERFORMANCE:** **+6%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Valley Ridge North)	**ALTERNATIVE NO.** 5.2 (P-13)	**PAGE NO** 2 of 7

DISCUSSION / JUSTIFICATION:

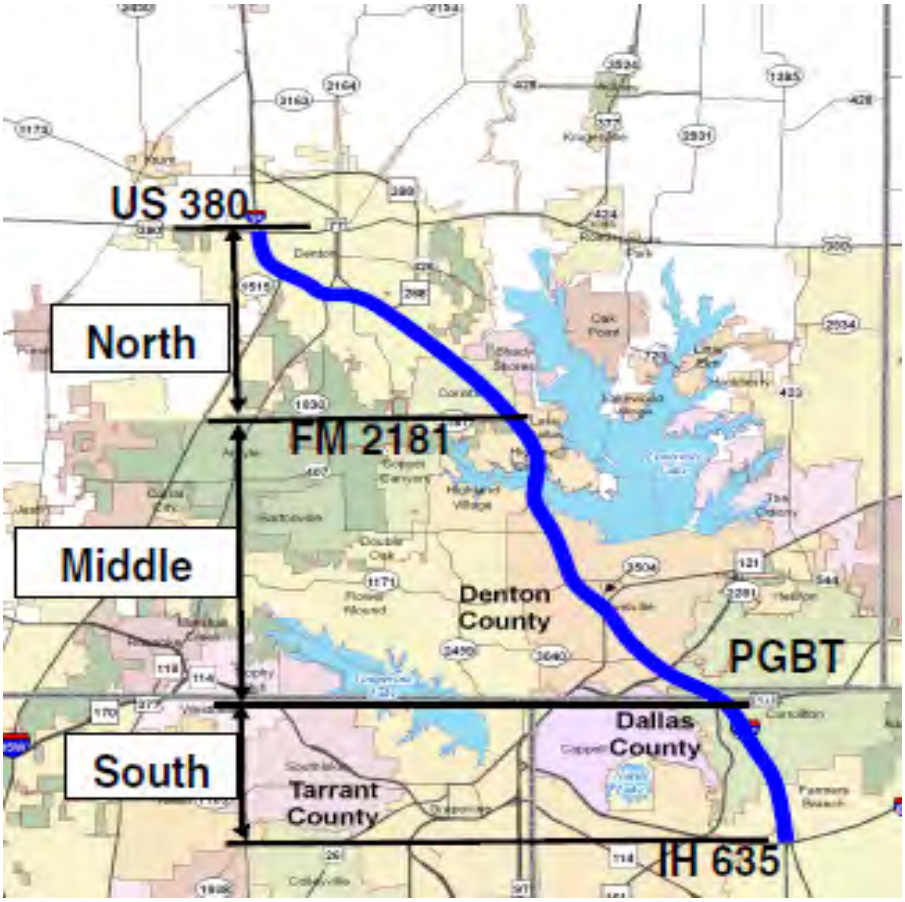
To reduce the scope to be in line with funding available today, including potential revenue generated by traffic. When extra funding is available, the remaining part of the Middle segment and all of the North section will be developed in 2040.

This alternative will potentially make a more financially viable project to begin construction in 2011.

SKETCHES *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Valley Ridge North)	**NUMBER** 5.2 (P-13)	**PAGE NO.** 3 of 7

Original Design

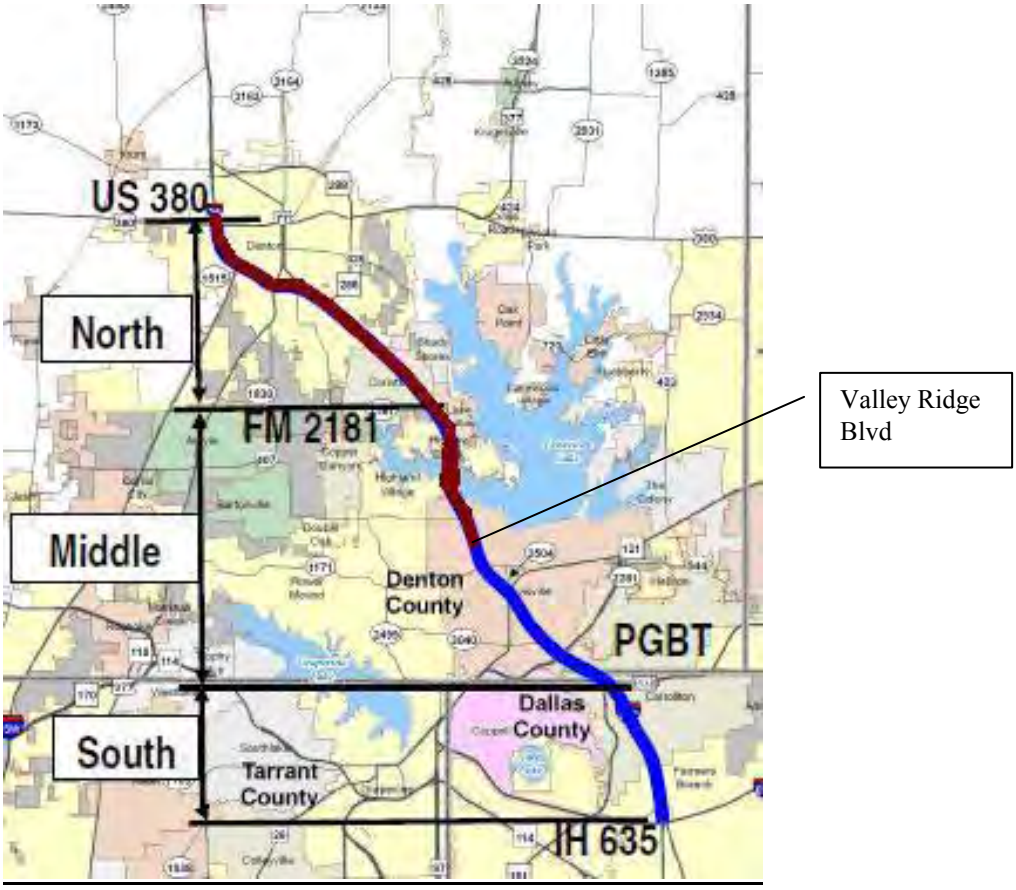
Construction of complete project (28 miles)



SKETCHES *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Defer ROW acquisition and construction of northern part of middle section and north section (defer Valley Ridge North)	**NUMBER** 5.2 (P-13)	**PAGE NO.** 4 of 7

Proposed Alternative

Only acquire ROW and construction the roadway up to Valley Ridge Blvd (12 miles)



PERFORMANCE *I-35E Managed Lanes Project*		**TxDOT/TTA**

Total Performance:		589	626
Net Change in Performance (%):			6%

Cost Assumptions:

- Middle section after Valley Ridge Blvd to FM2181: deferred cost saving is $945m, including ROW acquisition cost, utility, engineering cost, PS&E, construction saving. There is an additional pavement transition cost of $15m (see spreadsheet attached)
- North section: deferred cost saving is $1.271 billion
- Total upfront construction cost deferred is **$2.216 billion**
- The Construction costs and savings are summarized in the table below:

	Original Concept Costs ($m)	Proposed Alternative Costs ($m)	Upfront Cost Savings ($m)
North Section	1271	0	1271
Middle Section	1901	956	945
South Section	831	831	0
Total	**4,003**	**1,787**	**2,216**

Revenue Assumptions:

- Reduction in present value toll revenue if the construction of the road segment is deferred to 2040: $416m
- Total present value deferred cost saving to 2040 = $2,216m - $416m = **$1,800m**

P13 Alternative 2 - Defer Entire North Segment and Middle Segment to Valley Ridge

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	TxDOT/TTA	
FUNCTION: General/Phasing/Traffic Control	**IDEA NO.** P-19	**ALTERNATIVE NO.** 6.0
TITLE: Construct elevated Managed Lanes on outside, defer construction of GP lanes, FR, and cross streets		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Original concept is total reconstruction of facility with ML in the center at the same profile as GP lanes.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Construct elevated managed lanes on the outside of the existing GPs. Results in reduced footprint.

ADVANTAGES:

- Allows early and independent construction
- Reduces ROW costs
- Earlier revenue stream
- Reconstruction of existing General Purpose lanes, Frontage Roads, cross streets and bridges is deferred.
- Preserve existing HOV lanes (could be tolled as well, can be combined with VE Alt 4.0 (P-12)
- Easier to construct – connection, no wishbones
- Access from/to GPs would be on outside of GPs eliminating weave across 4 lanes
- ML structure could be combined with CD between PGBT and SH121.
- Allows for traffic control when GP lanes are constructed in the future

DISADVANTAGES:

- Makes access to ML less flexible
- May increase construction costs of managed lanes
- Detriment to aesthetics and noise
- Necessitate further analysis of weaving of on/off ramps – ML ramps are going to be introducing weaving with on/off ramps
- Additional ROW required for access ramps

*Cost summary does not include deferred construction costs. Includes only affected items such as ROW, rail & ML.

COST SUMMARY	Initial* Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 1,556,530,544	**$** 0	**$** 1,556,530,544

Savings	**$** 407,986,641	**$** 0	**$** 407,986,641

Team Member:	Spenta Irani, Charles Riou, Bill Reichert, Kim Daily	**Discipline:**	Design Design TTA Assistant	**PERFORMANCE:** **-2%**

DISCUSSION / JUSTIFICATION:

The primary justification for constructing elevated managed lanes and deferring the reconstruction of general purpose, frontage roads, and cross streets allows for an early revenue stream while adding capacity and reducing the ultimate ROW requirements. Cost of project to achieve managed lanes is reduced from $4B to $1B.

By deferring the construction of the general purpose lanes, frontage roads, and cross streets the total initial capital cost requirement to construct the project is reduced due to a decrease in pavement, excavation/embankment, structures and the roadway components. The cost to reconstruct these items will most likely cost more than the cost today. There will be a permanent reduction in ROW costs due to the elevated managed lanes reducing the footprint.

Because the elevated structures can be constructed with minimal impact to the existing facility (impacts at the tie-ins) and the construction duration is significantly reduced (reduction of less roadway), the revenue stream from the managed lanes can be collected sooner than in the baseline case. Additionally, because the capacity of the general purpose lanes is not increased until the general purpose lanes, frontage roads, and cross streets are constructed at a later date (deferred), and because the volume of traffic is expected to increase over time, it can be assumed that more traffic will use the managed lanes therefore reducing the ramp-up period on the managed lanes bringing in more revenue sooner.

Items to consider: the impact on revenue when the general purpose lanes and frontage roads are reconstructed. The assumed increase in capital costs to reconstruct the general purpose lanes and frontage roads when required.

By deferring the reconstruction of the GP lanes to 2030, it is assumed that more traffic will use the ML. The increase in revenue resulting from this increase in ML use is approximately $11M for the North, $63M for the middle, and $45M for the South, totaling an increase in revenue of $119M.

The cost of construction for this proposal does not include the cost of deferred items.

	Measure	Degree	Degree
	Rating		
	Weight		
	Contribution	0	0
Total Performance:		589	579
Net Change in Performance (%):			-2%

Assuming 77% of ROW savings where ROW is being purchased (non-COE property) based on previous ROW calculations for cost savings by TxDOT done 7/20/09.

Assume 20 year deferral of construction of general purpose lanes and frontage road lanes.

Saving upfront costs because segments of construction are deferred. Deferred costs have to consider the inflation that will take place until the project is built.

Assume access points in the proposal are the same as access points in the baseline.

Construction cost from baseline of items deferred =$373M (S)+$1,036M (M)+$597M (N) = $2B

VE TEAM ALTERNATIVE REVIEW *I-35E Managed Lanes Project*		TxDOT/TTA
TITLE:	Construct elevated Managed Lanes on outside, defer construction of GP lanes, FR, and cross streets	**NUMBER** 6.0 (P-19/P-21)

Team Member: Michael Drayton

☐ I have reviewed this alternative and agree with it as it is written
X I have reviewed this alternative and suggest the following (or attached) changes

Explicit note on what costs are included in cost summary

Team Member: Phil Ullman

☐ I have reviewed this alternative and agree with it as it is written
X I have reviewed this alternative and suggest the following (or attached) changes

Cost of structure assumes concrete structure. Due to ramping straddle bents and steel structure doubles cost ≈ $110/SF

Team Member: Lucio Vasquez

☐ I have reviewed this alternative and agree with it as it is written
X I have reviewed this alternative and suggest the following (or attached) changes

May be difficult to construct at areas pts and over existing roadway

Team Member: Eva Chan

☐ I have reviewed this alternative and agree with it as it is written

X I have reviewed this alternative and suggest the following (or attached) changes

The cost savings should be $407m + $2B (deferral) = $2.4B

Team Member: Mark Taylor

☐ I have reviewed this alternative and agree with it as it is written
X I have reviewed this alternative and suggest the following (or attached) changes

Disadvantage: Closure of ML during ice storms, loss of revenue & functionality

Team Member:

☐ I have reviewed this alternative and agree with it as it is written

☐ I have reviewed this alternative and suggest the following (or attached) changes

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**	
FUNCTION:	Maximize Funding, Allow Construction	**IDEA NO.** P38-39	**ALTERNATIVE NO.** 7.0
TITLE:	Interim Managed Lanes in the median south of US 77 to north of FM 2181 (Swisher Rd) – defer the ultimate construction		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: The original concept improves IH 35E to a 4-2-2-4 typical section from FM 2181 (Swisher Rd) to US 77 and includes reconstruction of the frontage roads and cross street interchanges.

ALTERNATIVE CONCEPT: The alternative concept is to defer construction of the ultimate improvements from FM 2181 (Swisher Rd) to US 77 and instead construct an interim managed lane system that connects to the ultimate IH 35E managed lane system constructed south of FM 2181 (Swisher Rd).

ADVANTAGES:

- Provides capacity improvements in a segment of IH 35E that currently only has 4 total lanes.
- Provides additional revenue for the corridor.

DISADVANTAGES:

- Construction is interim and depending upon identification of funding may only be in place for a few years.
- Requires design exceptions to implement.

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 18,546,400	**$** 0	**$** 18,546,400
Alternative Concept	**$** 0	**$** 0	**$** 0
Savings	**$** 18,546,400	**$** 0	**$** 18,546,400

Team Member: Chad Gardiner	**Discipline:** Design	**PERFORMANCE:** **+8%**

DISCUSSION / JUSTIFICATION:

There is a significant funding gap to construct the ultimate IH 35E improvements. In addition, traffic and revenue studies show that construction dollars for the ultimate improvements in the North Segment generate the least amount of revenue return when compared to the South and Middle Segments. Based on these results, the North Segment is the least attractive segment within the IH 35E Corridor to be included in a PPA or CDA project.

Interim improvements could provide capacity and bottleneck improvements in the North segment until funding is identified. This VE alternative analyzed extending an interim managed lane segment into the North Segment. Looking at the existing geometry and constraints, it would be too costly to extend and interim managed lane north of US 77. Therefore, the north limit was set at US 77. Also, because the Middle Segment is considered the priority segment by TxDOT and Denton County, the north limit of the Middle Segment was set as the southern limit for the interim managed lane. These limits provide a managed lane approximately 4.6 miles long.

In order to maintain the integrity of an enclosed, tolled system, it was assumed that a fixed barrier reversible managed lane would be constructed. A concurrent system could be constructed, but it would be buffer separated with limited shoulder widths which could present significant enforcement issues. The proposed interim typical section utilizes:

- 2 – 11’ GP lanes with 10’ outside shoulders and 2’ inside shoulders
- 1 – 12’ reversible managed lane with a 10’ and 2’ shoulder
- Fixed 2’ wide concrete barriers separating the GP and reversible managed lane.

This section allows for inside widening to be utilized throughout, including at bridges and overpasses. Limited outside widening was assumed in super elevated segments. It is assumed that 8’ outside shoulders are used on the GP lanes to fit within existing spans at underpasses. The US 77 ramps would be utilized as a lane add/drop to form a transitional area at the north end of the managed lanes. Another transitional/access area was assumed at the south end to transition from the interim reversible system to the ultimate concurrent managed lanes constructed with the Middle Segment. Constructing the interim managed lane would provide capacity improvements in a segment of IH 35E that currently only has 4 total lanes. It would also provide additional revenue for the corridor.

Other Opportunities to Extend the Interim Managed Lane

If the Middle Segment is initially constructed to south of Lake Lewisville with the remainder being deferred, the interim managed lane could be extended to south of Tuberville/Hundley (an additional mile) without significant cost. This segment of existing pavement has the median paved, and the only improvements needed would be restriping and barrier improvements. To extend to north of the lake would require additional inside and outside widening.

TxDOT currently has a North Early construction project for the ultimate IH 35E improvements from Loop 288 to North Texas Blvd. If construction money is identified for this segment, it could temporarily operate as reversible system and connect to the interim managed lane. A temporary conversion of the ultimate managed lane in this segment would require gates at US 77 and north of US 77.

	Contribution	0	0
Total Performance:		589	637
Net Change in Performance (%):			8%

- It was assumed that the entire Middle Segment was constructed.
- It was assumed that lane and shoulder width design exception could be granted for the interim typical section.
- Inside widening was assumed throughout with limited outside widening assumed in super elevated segments (due to existing PGL and axis of rotation).
- It is assumed that 8' outside shoulders are used on the GP lanes to fit within existing spans at underpasses.
- It is assumed that managed lane access would be provided S. of US 77, S. of Loop 288, & North of FM 2181.
- Limits of the "North Early" reversible managed lane and widening limits were determined, and quantities for these limits were measured/calculated by utilizing the proposed typical section, topographic information, and existing IH 35E record plans.

See attached estimate for cost calculations. The basis for calculating quantities:

- Calculated pavement quantities by multiplying the project length (ft) by the width (ft) of widening and converting to SY
- Earthwork quantities were developed by comparing the proposed widening pavement section to the existing typical section, and developing an average area of cut and fill per linear foot of roadway. These areas were multiplied by the length of widening and converted to cubic feet.
- Bridge widening was calculated by comparing the existing bridge widths from the record plans to the proposed typical section. It was assumed that the existing inside rails would be removed and the bridge deck and bents would be widened to the inside.
- Topographic information and the proposed typical section were utilized to quantify culvert lengthening, inlet relocations, and signage relocations.
- Guide signs and managed lane gate systems were added at the proposed reversible managed lane access locations.
- Costs for removals, striping, SWPPP, CTB, and toll enforcement were quantified from the typical section and/or project length.
- The interim pavement widening section was assumed to be 12" of cement treated subgrade, 10" base course, and 2" surface course. These items required rates not included within the original estimate.
- The ROW Prep rate was reduced to $1000/sta for the interim widening.
- Bridge widening was not included in the original estimate. A rate of $85/sf was assigned to this estimate.
- Toll access gate systems were not a part of the original estimate. They are needed for a reversible system and a unit rate of $30,000/each was assigned to this estimate.
- A reduced toll enforcement rate of $700,000/mile was used for this estimate to accurately depict the tolling system that would be constructed.
- The estimate assumes no ROW is required.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: General/Phasing/Traffic Control	**IDEA NO.** P-61	**ALTERNATIVE NO.** 8.0
TITLE: Alternative Pavement Section		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The pavement section for the GPs, MLs, ramps, DCs, and CDs assumes a 48" flexible pavement section. The pavement section for the frontage roads and cross streets assumes a 34" pavement section.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

This alternative concept assumes a reduced concrete section (34") for GPs, MLs, ramps, DCs, and CDs. The pavement section for the frontage roads and cross streets for this alternative concept assumes a 24" pavement section.

ADVANTAGES:

- Reduction in maintenance costs.
- Longer pavement life

DISADVANTAGES:

- Increase in initial upfront capital costs.
- Concrete may be more complicated to construct.
- Concrete takes longer to construct.
- Concrete is noisier.
- Geotechnical investigation required

COST SUMMARY	**Initial Cost**	**Present Value Subsequent Cost**	**Net Present Value**
Original Concept	**$** 428,035,000	**$** 2,305,000,000	**$** 2,733,000,000
Alternative Concept	**$** 510,654,000	**$** 1,640,000,000	**$** 2,150,654,000
Savings	**$** (82,619,000)	**$** 665,000,000	**$** 582,346,000

Team Member:	Spenta Irani, Charles Riou, Bill Reichert, Kim Daily	**Discipline:**	Design Design TTA Assistant	**PERFORMANCE:**	**-4%**

DISCUSSION / JUSTIFICATION:

This proposal could be considered as an alternate bid – flexible section versus concrete section. Studies undertaken for the value engineering workshop resulted in the concrete section costing more. Life cycle costs for the pavements indicate that the upfront costs would result in a lower maintenance cost over 30 years (and / or 50 years).

Lifecycle costs, in 2010 money, for 30 years are approximately:

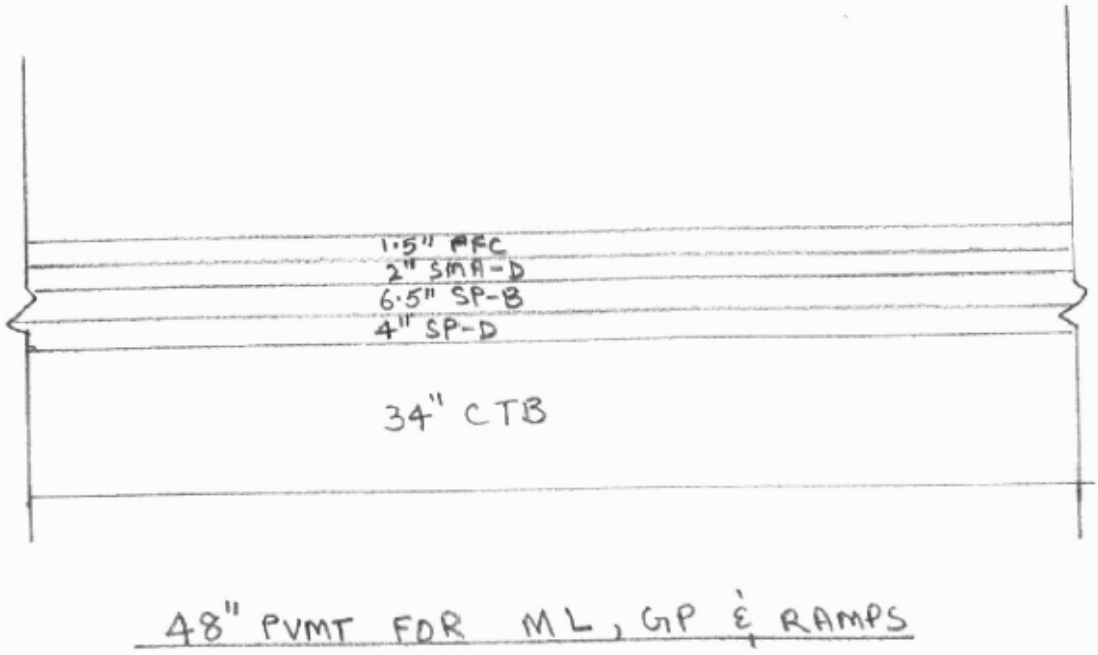
Service Life – Original (N) = $872M
Service Life – Alternative (N) = $617M

Service Life – Original (M) = $1B
Service Life – Alternative (M) = $714M

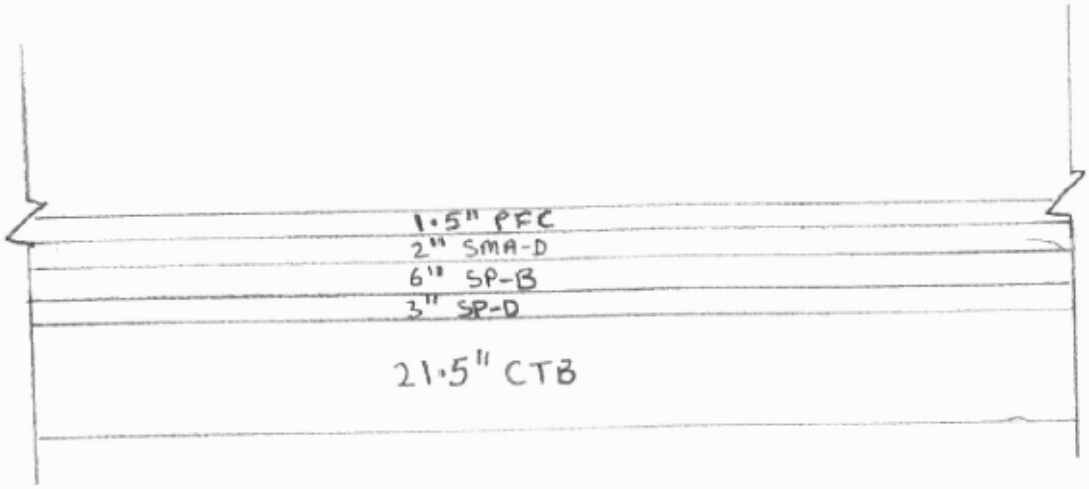
Service Life – Original (S) = $433M
Service Life – Alternative (S) = $309M

Total: Original: $2,305,000,000
Alternative: $1,640,000,000

Original Design



48" PVMT FOR ML, GP & RAMPS



34" PVMT FOR FR's & CROSS STREETS

Proposed Alternative

Total Performance:		589	563
Net Change in Performance (%):			-4%

It is assumed that the difference in width of the CTB layer between the baseline and the proposal is negligible although the depth of CTB in the proposal is reduced.

The assumed pavement section for concrete pavement is 13" concrete pavement, 4" HMA, and 17" CTB for GPs, MLs, ramps, DCs, and CDs. The assumed pavement section for frontage roads is 11" concrete pavement, 3" HMA, and 10" CTB.

It is assumed that the savings/additional costs in excavation and embankment is equal to the length of the project times the difference in thickness of pavement sections. Assuming for this exercise that the additional embankment cost is offset equally by the reduction of excavation.

It is assumed that existing geotechnical investigations allow for this alternative pavement design.

The proposal assumes the difference in cost for the quantity difference of tack coat is negligible.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**	
FUNCTION:	Optimize maintenance strategy	**IDEA NO.** P-46	**ALTERNATIVE NO.** 9.0
TITLE:	5-year maintenance contract post construction completion, 15-year CMA post construction completion		**PAGE NO.** 1 of 4

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The Concessionaire/Design-Builder is responsible for maintaining the ML for a period of 50 years. TxDOT will undertake the maintenance for GP and Frontage Roads.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Let 5-year maintenance contracts post construction completion of the full scope for all the lanes. This enables other contractors to bid for these maintenance services.

ADVANTAGES:

- Eliminates hand back costs associated with 50-yr concession
- Increases flexibility for TxDOT to manage maintenance contracts

DISADVANTAGES:

- Complicated contracting
- Higher administration cost by TxDOT
- Warranty period of only 2 years compared to concessionaire maintaining for the entire concession period
- CMA contains lower maintenance standards

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 0	**$** 401m	**$** 401m

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	TxDOT/TTA	
TITLE: 5-year maintenance contract post construction completion, 15-year CMA post construction completion	**ALTERNATIVE NO.** 9.0 (P-46)	**PAGE NO** 2 of 4

DISCUSSION / JUSTIFICATION:

By the time the project is procured, the legislation might not support a 50-year Concession project and therefore CMA's may be more appropriate for procurement of the maintenance activities.

With the 5-year capital maintenance agreements post construction completion, the handback provisions of a concession agreement will not be required. Instead the equivalent cost will be pushed further into the future and spent on capital maintenance under the normal improvement schedule.

PERFORMANCE *I-35E Managed Lanes Project*	TxDOT/TTA

Total Performance:		589	602
Net Change in Performance (%):			2%

Cost Assumptions:

Assume the handback costs at the end of the Concession Period are eliminated. The total amount eliminated in 2010 $ is $401m. However, this is not projected as immediate upfront construction cost savings. This is a cost saving over time and would eventually be incurred as part of normal capital maintenance activities beyond a 50yr Concession.

Handback cost saving at year 2066:

	ML ($m)	GP ($m)	FR ($m)	Total ($m)
North Section	56	85	8	149
South Section	28	43	4	75
Middle Section	68	101	9	178
			All sections	401

Handback costs are for DB/Concession are not TxDOT. Are you assuming a $401M reduction in cost to the project after construction?

This assumes we go with a D/B procurement. If TxDOT gets CDA a mouth, we will go with a concession procurement. However, for this VE exercise, the analysis is good.

FUNCTION:	Separate Grades, Eliminate Conflicts	**IDEA NO.** M-10	**ALTERNATIVE NO.** 10.0
TITLE:	Revise wishbone design (instead of going over, go under)		**PAGE NO.** 1 of 6

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Baseline design calls for wishbone design over mainline bridges

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Revise wishbone design to go under mainline bridges

ADVANTAGES:

- Less complicated construction
- Standard bridge on main lanes instead of large flyover
- Better main lane sight lines for adjacent properties
- More consistent main lane grades
- No straddle bents
- No steel spans

DISADVANTAGES:

- Additional main lane bridge
- Main lanes elevated (may also be an advantage)

Flyover Wishbones (Baseline)

Given the long span, steel beams, and straddle bents over main lane traffic, a straight forward cost estimate based on square footage will under estimate the actual cost of a flyover ramp. This is due to the additional cost of massive columns and straddle bents, along with difficulty of construction. Therefore and estimate of $10m per wishbone was used.

Main Lanes Over Wishbone Ramps (Alternate)

A basic, standard main lane bridge is built over the wishbone ramps. The ramps are woven through bridge columns so as not to impact the bent design. Costs are as follows:

1000’ of at grade wishbone ramp = (1000)(28)($7/SF) = $0.20m

1000’ of CTB x 2 sides = (2)(1000)($50/LF) = $0.10m

400’ of standard bridge ($50/sf)

5 lanes = (80)(400)(50) = $1.6m

4 lanes = (70)(400)(50) = $1.4m

3 lanes = (60)(400)(50) = $1.2m

Note: $2m per side was used to account for miscellaneous barriers, walls, etc.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
FUNCTION: Carry Traffic, Increase Capacity		**IDEA NO.** M-2	**ALTERNATIVE NO.** 11.0
TITLE: Remove CDs between PBGT and SH 121			**PAGE NO.** 1 of 6

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Continuous CD road between PBGT and SH 121 interchanges.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Widen mainlanes from 3 to 5 lanes & use auxiliary lanes where needed.

ADVANTAGES:

- Simplifies 3 level interchange at FM 3040
- Could allow for future construction of CDs
- Saves about $30m

DISADVANTAGES:

- Traffic function will not be as good
  - Increased weaving
  - Diminishing returns on main lanes after exceeding 5 lanes in width
- Difficulty with existing interchange columns

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 22m	**$** 0	**$** 22m
Alternative Concept	**$** 0	**$** 0	**$** 0

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	**TxDOT/TTA**
TITLE: Remove CDs between PBGT and SH 121	**ALTERNATIVE NO.** **11.0 (M-2)** / **PAGE NO** 2 of 6

DISCUSSION / JUSTIFICATION:

By removing CD roads, there is less pavement being constructed due to the merging of the 2 CD lanes onto the GP lanes. The bulk of savings is in the removal of long CD bridges (between Frankford & SH 121) being used to bridge over exit ramps & cross streets (FM 3040).

Although the main lanes are being widened, there will still be adequate width to fit CD roads in the later, when traffic necessitates and funding allows.

It also simplifies some of the connections between the managed lanes and the GP lanes & frontage road because there is one less roadway to deal with.

Wider GP lanes will also facilitate traffic control during construction, thus decreasing construction time.

Design challenges will be ramp spacing, and avoiding columns at the existing interchanges ~ but shoulders can be reduced for "relatively short" distances, less than 2000', without requiring a design exceptions.

Original Design

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Construct Corporate, FM 407, Country Lane/S Denton, Turbeville over IH 35E	**ALTERNATIVE NO.** 12.0 (M-5, 7, 11, 12)	**PAGE NO** 2 of 5

DISCUSSION / JUSTIFICATION:

The original design has I-35E cross over many cross streets. This VE concept recommends bringing those cross streets over I-35E. The average cross streets are 2-4 lanes wide, versus the I-35E with 4 MLs and 8 GP lanes. Therefore, the size of the bridge will be significantly reduced, as well as the construction complexity will be simplified. These selected locations will remain existing configurations.

X I have reviewed this alternative and suggest the following (or attached) changes

What was the performance: a “-2%” or a “+2%”?

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
FUNCTION:	Span Water, Carry Traffic	**IDEA NO.** M-6	**ALTERNATIVE NO.** 13.0
TITLE:	Shorten Bridge (over water) length		**PAGE NO.** 1 of 6

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Construct entire Lake Lewisville crossing on bridge.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Construct Lake Lewisville crossing on embankment (Causeway) with 1000' bridge at current bridge location.

ADVANTAGES:

- Reduces structure cost
- Easier to construct

DISADVANTAGES:

- Must mitigate fill within flood storage
- Reduces flexibility for future parking area under bridge
- Unknown flood / erosion impacts

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** $258,915,655	**$** 0	**$** $258,915,655

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	**TxDOT/TTA**	
TITLE: Shorten Bridge (over water) length	**ALTERNATIVE NO.** 13.0 (M-6)	**PAGE NO** 2 of 6

DISCUSSION / JUSTIFICATION:

The highway, in its current configuration is built on fill with a single bridge opening (1000' span). The original concept calls for a 9100' bridge spanning the entire lake. The reason for this is the avoidance of mitigation for additional fill to be placed in the lake as required by the COE. This alternative concept will require additional coordination with the COE to find a suitable location to mitigate the loss of lake capacity. Assuming mitigation is feasible, the concept will result in substantial savings in cost and construction time.

SKETCHES *I-35E Managed Lanes Project*		TxDOT/TTA

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: General/Phasing/Traffic Control	**IDEA NO.** M-8	**ALTERNATIVE NO.** 14.0
TITLE: Eliminate new frontage road construction over Lake Lewisville		**PAGE NO.** 1 of 5

ORIGINAL CONCEPT: (Attach sketch where appropriate)

Construct continuous frontage roads over Lake Lewisville.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

This alternative assumes a frontage road will not be built across Lake Lewisville.

ADVANTAGES:

- Save cost (majority of bridges, most of the bridges over Lake Lewisville)
- Use of more of existing structure (bridge over lake)
- Reduces impact to COE recreation area.
- Reduces maintenance cost
- Reduces columns in flood storage area
- Increases revenue on managed lanes

DISADVANTAGES:

- Affects access to COE recreation area. (Would change mitigation and access plan.)
- Incident management flexibility is reduced.
- Access issues
- Increases congestion on general purpose lanes

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	TxDOT/TTA	
TITLE: Eliminate new frontage road construction over Lake Lewisville	**ALTERNATIVE NO.** 14.0 (M-8)	**PAGE NO** 2 of 5

DISCUSSION / JUSTIFICATION:

By construction of the frontage roads where over Lake Lewisville, the initial capital costs are reduced while the level of service on the GPs and MLs are not significantly impacted. The frontage road section being investigated, in the baseline case, provides frontage road continuity and a sidewalk for pedestrians.

The managed lanes could be used for incident management.

Because the quantity of bridges is being reduced, the cost of maintenance is reduced.

PERFORMANCE *I-35E Managed Lanes Project*	**TxDOT/TTA**		
TITLE: Eliminate new frontage road construction over Lake Lewisville	**NUMBER** 14.0 (M-8)		**PAGE NO.** 3 of 5

CALCULATIONS/ASSUMPTIONS *I-35E Managed Lanes Project*	**TxDOT/TTA**	
TITLE: Eliminate new frontage road construction over Lake Lewisville	**NUMBER** 14.0 (M-8)	**PAGE NO.** 5 of 5

Assuming can use the existing bridge over Lake Lewisville for some of the NB GP lanes and NB ML plus pedestrian walkway. (Interim condition will have 3 GP lanes (no pedestrian walkway) in each direction due to constructability of using the existing structure. The ultimate will accommodate pedestrians in the same manner as the baseline.)

Assume that COE recreation area mitigation will be reduced with elimination of FR.

Assume existing bridge has at least 20 years usable life left. (Assumed in baseline as well.)

INITIAL COSTS

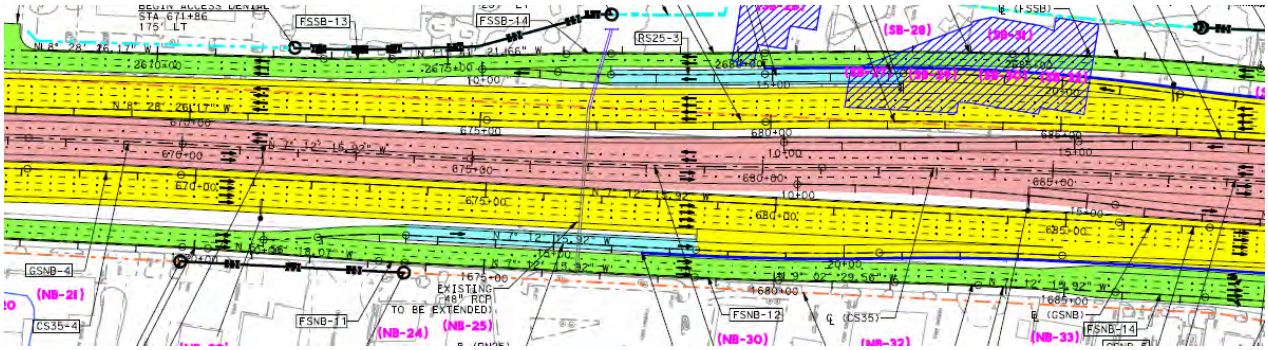
VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: Facilitate Access	**IDEA NO.** S-13	**ALTERNATIVE NO.** 15.0
TITLE: Extend frontage road (auxiliary lanes) from ramp to ramp instead of ramp to cross street		**PAGE NO.** 1 of 5

ORIGINAL CONCEPT: (Attach sketch where appropriate)



ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

Extend frontage road (auxiliary lanes) from ramp to ramp instead of ramp to cross street

ADVANTAGES:

- Reduces upfront cost by eliminating 12' lanes
- Reduces maintenance cost
- Reduces weaving distance
- May expand at a later date, if warranted

DISADVANTAGES:

- Congestion concerns
- May deviate from previous commitments to stakeholders
- Environmental assessment may need to be redone

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	$ $3,493,000	$ 0	$ $3,493,000
Alternative Concept	$ $2,329,000	$ 0	$ $2,329,000
Savings	$ $1,164,000	$ 0	$ $1,164,000

Team Member:	Mark Taylor Spenta Irani, Charles Riou, Bill Reichert, Kim Daily	**Discipline:**	Design Design Design TTA Assistant	**PERFORMANCE:**	**-8%**

DISCUSSION / JUSTIFICATION:

There are several areas in the south segment that may benefit from a reduction in the number of frontage lanes without sacrificing access.

Removing a 12' frontage road from ramp to cross-street reduces the upfront cost of the project, along with a savings in future maintenance work.

Following stations are sections that may be eliminated:

Northbound

671+00 to 686+00

785+00 to 806+00

843+00 to 866+00 (includes approx. 250 ft. of bridge)

Southbound

639+00 to 654+00

763+00 to 776+00 (includes approx. 200 ft. of bridge)

.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	**TxDOT/TTA**	
FUNCTION: Allow Construction	**IDEA NO.** P-1	**ALTERNATIVE NO.** 16.0
TITLE: Allow purchase of ROW (by individual parcel or selected) but defer construction of north segment. If possible, lease back ROW to market when available.		**PAGE NO.** 1 of 5

ORIGINAL CONCEPT: The current plan is to acquire all the right of way (ROW) on the north segment, demolish the structures, relocate utilities and then construct new frontage roads and the full roadway cross section.

ALTERNATIVE CONCEPT: The alternative concept is to defer construction of the entire north improvements from FM 2181 to US 380 and instead just purchase the ROW needed.

ADVANTAGES:

- Defers $662.9M in construction costs until funding is available.
- Allows acquisition of ROW from property owners, especially those displaced, earlier than when full funding becomes available.
- Allows displaced property owners to lease back their properties and can remain in their home or business as long as possible.
- May generate revenue from leases, but may be a low return due to property management costs.

DISADVANTAGES:

- Does not provide any congestion relief for the north segment in the interim period.
- Requires TxDOT to become real estate property managers or hire professional property managers to maintain property and collect rents.
- Properties may still become derelict since they will eventually be demolished.

COST SUMMARY	**Initial Cost**	**Present Value Subsequent Cost**	**Net Present Value**

Team Member: Matt Craig	**Discipline:** Design	**PERFORMANCE:** **-6%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Allow purchase of ROW (by individual parcel or selected) but defer construction of north segment.	**ALTERNATIVE NO.** 16.0 (P-1)	**PAGE NO** 2 of 5

DISCUSSION / JUSTIFICATION:

There is a significant funding gap to construct the ultimate IH 35E improvements. In addition, traffic and revenue studies show that construction dollars for the ultimate improvements in the North Segment generate the least amount of revenue return when compared to the South and Middle Segments. Based on these results, the North Segment is the least attractive segment within the IH 35E Corridor to be included in a PPA or CDA project.

Due to this limited funding and lower revenue potential, the construction of the north segment may be deferred until funding becomes available. However, once environmental clearance has been obtained, the ROW acquisition could begin as the first stage of project development.

The $425M cost for acquisition of the ROW will be about 33% of the total north segment costs. At least $663M in construction costs will be deferred. The remaining $183M in utility relocation and engineering could also be deferred for a total deferral of $846M. This is 67% of the total north segment cost of $1,271M.

PERFORMANCE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE: Allow purchase of ROW (by individual parcel or selected) but defer construction of north segment.		**NUMBER** 16.0 (P-1)	**PAGE NO.** 3 of 5
CRITERIA	**Performance**	**Original**	**Alternative**
REVENUE IMPACTS: Although it does not generate revenue, it defers costs to a later date.	Measure	Degree	Degree
	Rating	6	7
	Weight	18	18
	Contribution	108	126
TRAFFIC OPS - GENERAL PURPOSE LANES: Deferral of reconstruction will cause the continued increase in congestion.	Measure	Degree	Degree
	Rating	8	6
	Weight	17	17
	Contribution	136	102
TRAFFIC OPS - LOCAL: Deferral of reconstruction will cause the continued and increased level of congestion, but to a lesser extent to the local cross streets and frontage roads	Measure	Degree	Degree
	Rating	8	7
	Weight	12	12
	Contribution	96	84
RIGHT OF WAY IMPACTS: No change in ROW limnits	Measure	Degree	Degree

CALCULATIONS/ASSUMPTIONS *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Allow purchase of ROW (by individual parcel or selected) but defer construction of north segment.	**NUMBER** 16.0 (P-1)	**PAGE NO.** 4 of 5

- It was assumed that design and utility relocation would not occur until funding becomes available for construction.
- Assumes the rate of construction inflation will equal the interest cost so that there is no adjustment for net present value (cost or savings) by deferring construction.

See attached estimate for cost calculations.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: Connect Roadways, Separate Grades	**IDEA NO.** 17.0	**ALTERNATIVE NO.** N-2, N-7
TITLE: **Flip the connection at US 77 with IH 35E at grade.**		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The original design of the IH 35E / US 77 interchange has the IH 35E main lanes on structure with the US 77 highway going under the interstate and connecting using 5 ramps (2 to the managed lanes, 1 to the southbound general purpose lanes, and 2 to the frontage roads)

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

The alternative concept design of the interchange keeps IH 35E at grade and has US 77 going up and over the interstate before connecting through four ramps (2 to the managed lanes and 2 to the frontage roads). This concept allows the southbound braided ramps, just north of US 77 Interchange, to be removed. The entrance ramp in this braided ramp configuration is relocated to the south of the entering US 77 SB traffic.

ADVANTAGES:

- Lowers freeway, potentially reducing noise
- Reduces bridge structure which reduces structural cost
- Removes braided ramp on SB IH 35E, just north of the US 77 interchange
- Eliminates double gores (SB)

DISADVANTAGES:

- May cause weaving issues on frontage roads
- Impacts at least two additional residential houses
- Removes the Pennsylvania/San Jacinto & IH 35E interchange

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	**$** 23,934,000	**$** 0	**$** 23,934,000

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*	**TxDOT/TTA**	
TITLE: Flip the connection at US 77 with IH 35E at grade.	**ALTERNATIVE NO.** 17.0 (N-2, N-7)	**PAGE NO** 2 of 7

DISCUSSION / JUSTIFICATION:

Flipping the connection between US 77 and IH 35E has the potential of cutting construction costs. Further development and investigation of this concept would be required. Initial review of the vertical profiles show that flipping this interchange may be possible. If possible, approximately $15 Million in structural cost could be saved. The cost comparison, for purposes in this ve study, only deduct pavement and structure costs. Much more detail in design would be required to determine the quantities of change in retaining wall, sound wall, cut & fill, as well as other items included in the construction costs. In addition to flipping this interchange, we also reconfigured the connection between the managed lanes. Both ramps were relocated to merge into the center of the managed lanes on the interstate. This would save money by keeping these two facilities on the same structure. The SB US 77 to IH 35E general purpose lanes and the SB US 77 to IH 35E frontage road ramps were also merged into a two lane ramp to the IH 35E frontage road. An entrance ramp was then added to the south. Relocating this entrance ramp to connect to the frontage road then allowed removing the entrance ramp approximately 1,000 feet to the north (part of the existing braided ramp configuration). Flipping the interchange presented in this concept would also eliminate the San Jacinto crossing of IH 35E.

A minimum of two additional residential houses would be impacted from implementing this concept. Additional ROW to the west of the interstate may be required in order to relocate the SB entrance ramp. Access along the southbound frontage road would be removed to several cross-streets; however, access could be maintained by modifying the cross-streets and cul-de-sacs.

Original Design

Total Performance:		589	583
Net Change in Performance (%):			-1%

Assumptions:

For cost comparison, only bridge structure and at grade pavement were calculated. Additional detailing would be needed to accurately estimate the changes in retaining wall, sound wall, and cut and fill estimate. A redesign of the interchange was performed in microstation and measurements of the structure and pavements were taken. The proposed bridge for each alternative was measured and a difference in the structure that would turn into pavement was then included in a cost for the alternative design.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		**TxDOT/TTA**
FUNCTION: Separate Traffic, Eliminate Conflicts	**IDEA NO.** N-3, N-8	**ALTERNATIVE NO.** 18.0
TITLE: Combine exit ramps from US 77 to IH 35E, relocate braided ramp to south		**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The original concept included two separate ramps from US 77 to IH 35E, one of which went to the general purpose lanes and the other went to the frontage roads. Further upstream on IH 35E, a braided ramp configuration is present on the southbound direction

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

This alternative concept would merge the two ramps from US 77 to go to the IH 35E southbound frontage road. A proposed entrance ramp to the south would then connect the frontage road to the interstate. The addition of this impact could warrant removing the entrance ramp approximately 1000 feet to the north and simply relocate it to the south.

ADVANTAGES:

- Reduction in cost
- Removes braided ramp

DISADVANTAGES:

- May cause weaving issues on frontage roads
- Potentially lead to additional row impacts

COST SUMMARY	**Initial Cost**	**Present Value Subsequent Cost**	**Net Present Value**
Original Concept	**$** 1,535,250	**$** 0	**$** 1,535,250
Alternative Concept	**$** 157,061	**$** 0	**$** 157,061
Savings	**$** 1,378,189	**$** 0	**$** 1,378,189

Team Member: Jeremy McGahan	**Discipline:** Designer	**PERFORMANCE:** **-2%**

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
TITLE:	Combine exit ramps from US 77 to IH 35E, relocate braided ramp to south	**ALTERNATIVE NO.** 18.0 (N-3, N-8)	**PAGE NO** 2 of 7

DISCUSSION / JUSTIFICATION:

This alternative concept is pretty straight forward. The concept is to merge the US 77-IH 35E general purpose and frontage road ramps to a two lane ramp to the frontage road. It then includes relocating the IH 35E entrance ramp just north of the interchange to the south to accommodate the traffic from US 77. Overall, it would basically reduce one ramp from the project. Negative impacts from this alternative concept would include potential row impacts to the west of the interstate to accommodate the ramp relocation. The concept has the potential of saving approximately $1 million in structural costs.

	Contribution	0	0
Total Performance:		589	580
Net Change in Performance (%):			-2%

Assumptions include:

Only structure and pavement costs were analyzed in the cost comparison. Additional detailing would need to be performed to determine the change in retaining walls, sound walls, cut and fill, and other construction cost items. The cost comparison basically entails removing a bridge ramp from the project and adding that same length of pavement to the at-grade frontage road.

VALUE ENGINEERING ALTERNATIVE *I-35E Managed Lanes Project*		TxDOT/TTA	
FUNCTION: Carry Traffic, Support Loads		**IDEA NO.** N-5	**ALTERNATIVE NO.** 19.0
TITLE: Push NB General Purpose lanes out at I-35W to eliminate one bridge			**PAGE NO.** 1 of 7

ORIGINAL CONCEPT: (Attach sketch where appropriate)

The original concept allows for the NB IH 35E GP lanes to overpass the NB IH 35W GP lanes. IH 35W underpasses IH 35E and merges with IH 35E on the right side. This concept treats IH 35E as the "primary" roadway. It also allows IH 35W to have an exit to Oak Street, which is an important access location to the Rayzor Ranch development north of Oak Street and east of IH 35.

ALTERNATIVE CONCEPT: (Attach sketch where appropriate)

The alternative concept pushes the NB IH 35E GP lanes easterly and allows IH 35W to merge with IH 35E on the left side (inside) of the IH 35E GP lanes. This allows the NB IH 35E GP bridge to be eliminated. It also provides an opportunity to reconfigure the NB braided ramps north of Bonnie Brae to an x-ramp configuration. This alternative concept requires eliminating the NB IH 35W exit to Oak Street.

ADVANTAGES:

- Reduces cost by eliminating the NB IH 35E GP Bridge and reconfiguring the NB IH 35E braided ramps north of Bonnie Brae to an x-ramp configuration.
- Increases the weaving distance between the IH 35E/IH 35W merge and the NB exit ramp to US 380.

DISADVANTAGES:

- Eliminates the NB IH 35W exit to Oak St, which may not be acceptable by the North Segment stakeholders.
- Does not meet driver expectation on IH 35E with the IH 35W junction on the left side.
- Potential weaving issues with relocated ramp.
- Switching the GP locations could present a new conflict between the roadways during construction.

COST SUMMARY	Initial Cost	Present Value Subsequent Cost	Net Present Value
Original Concept	$ 4,230,000	$ 0	$ 4,230,000
Alternative Concept	$ 960,000	$ 0	$ 960,000

TITLE:	Push NB General Purpose lanes out at I-35W to eliminate one bridge	**ALTERNATIVE NO.** 19.0 (N-5)	**PAGE NO** 2 of 7

DISCUSSION / JUSTIFICATION:

The alternative concept pushes the NB IH 35E GP lanes easterly and allows IH 35W to merge with IH 35E on the left side (inside) of the IH 35E GP lanes. The alternative concept would reduce costs by reducing embankment quantities, retaining wall quantities, and eliminating 3 bridges. It would also increase the weaving distance between the IH 35E/IH 35W merge and the exit ramp to US 380 from ~1900' to ~2500'. This alternative would also allow the NB braided ramps north of Bonnie Brae to be reconfigured to an x-ramp configuration. This reconfiguration would eliminate a ramp bridge and create an ~1800' weaving segment between the Bonnie Brae entrance and US 380 exit ramps. In the original concept, the distance between these ramps is over 2500' and is not considered a weaving segment.

From a construction standpoint, the alternate design could potentially complicate phasing because it requires switching the locations of the NB lanes for IH 35E and IH 35W. The original design allows the roadways to be constructed without presenting a conflict between the two traffic streams. Depending on the final location of the merge between IH 35E & IH 35W, the alternate concept does potentially create a scenario where 4 weaving movements are located within one weaving segment (IH 35 merge / US 380 ramp and Bonnie Brae Ramp / US 380 ramp). Additional work would need to be done to finalize the merge locations and analyze the traffic impacts. Also, the alternate concept would require eliminating the IH 35W NB exit ramp to Oak Street. This exit ramp is an important access point to the City of Denton, as it provides IH 35W access to: 1) the Rayzor Ranch development north of Oak Street and east of IH 35, 2) Presbyterian Hospital of Denton, and 3) two large distributors west of IH 35 (Bennie E. Keith and Miller). Losing this access point may not be acceptable to the City of Denton and the adjacent property owners.

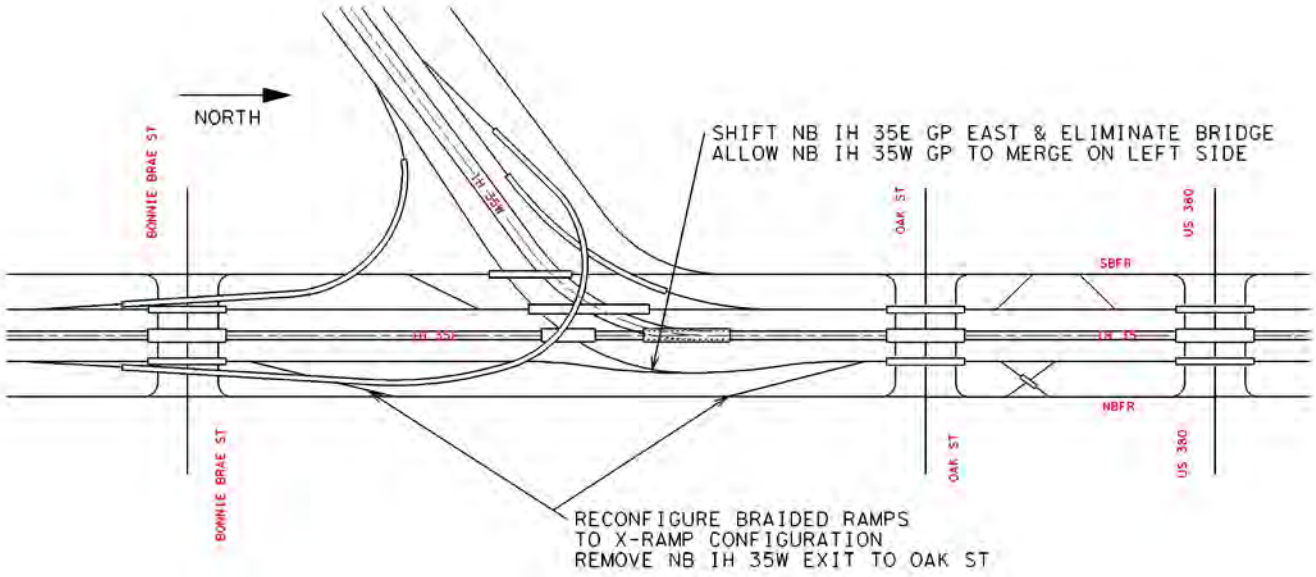
Proposed Alternative



PERFORMANCE *I-35E Managed Lanes Project*	**TxDOT/TTA**		
TITLE: Push NB General Purpose lanes out at I-35W to eliminate one bridge	**NUMBER** 19.0 (N-5)		**PAGE NO.** 5 of 7
CRITERIA	**Performance**	**Original**	**Alternative**
REVENUE IMPACTS: No impact. The overall cost of the project would be slightly reduced.	Measure	Degree	Degree
	Rating	6	6
	Weight	18	18
	Contribution	108	108
TRAFFIC OPS - GENERAL PURPOSE LANES: Additional analysis would be needed to accurately determine the impact of the weaving segment and left handed merge associated with this alternative.	Measure	Degree	Degree
	Rating	8	8
	Weight	17	17
	Contribution	136	136
TRAFFIC OPS - LOCAL: Elimination of the NB IH 35W exit ramp to Oak Street would create a significant detour for traffic travelling to the southern half of the Rayzor Ranch development, Presbyterian Hospital, and distributors southwest of Oak & IH35.	Measure	Degree	Degree
	Rating	8	6
	Weight	12	12
	Contribution	96	72
RIGHT OF WAY IMPACTS: No impact.	Measure	Degree	Degree
	Rating	3	3
	Weight	10	10
	Contribution	30	30
ENVIRONMENTAL IMPACTS: No impact.	Measure	Degree	Degree
	Rating	7	7
	Weight	14	14
	Contribution	98	98
STAKEHOLDER ACCEPTANCE: Removing the NB IH 35W exit to Oak Street would not be desirable for the North Segment stakeholders.	Measure	Degree	Degree
	Rating	7	5
	Weight	13	13
	Contribution	91	65
SCHEDULE IMPACT: Removing the NB IH 35W exit to Oak Street would require going back to the stakeholders for their approval.	Measure	Degree	Degree
	Rating	5	4
	Weight	6	6
	Contribution	30	24
	Measure	Degree	Degree
	Rating		
	Weight		
	Contribution	0	0
Total Performance:		589	533
Net Change in Performance (%):			-10%

- Alternate design presents a savings of $3.27M. For cost calculations, see initial calculations spreadsheet.

- Assumed that the braided ramps could be reconfigured to an x-ramp configuration to maintain 1000' weaving on frontage roads and 1800' weaving on mainlanes between the NB entrance from Bonnie Brae and the NB exit to US 380.

- Alternate concept assumes that additional bridge would be needed at the Oak Street overpass to facilitate the NB Bonnie Brae entrance ramp taper. Assumption was made that the additional bridge needed at Oak Street is a wash with bridge needed for the entrance ramp taper in the current design.

- Alternate concept assumes that TxDOT would allow for IH 35W to merge with IH 35E on the left side.

PROJECT ANALYSIS

SUMMARY OF ANALYSIS

The following value engineering tools were used to study the project:

- Project Issues
- Site Visit Observations
- Cost Model
- Function Analysis
- Performance Criteria Matrix
- Performance Rating Matrix

PROJECT ISSUES

The following project issues were identified and addressed by the VE team:

- Substantial funding gap
- Baseline improves performance significantly, compared to "no build"
- Strong stakeholder support as currently envisioned
- Key high cost items such as bridges
- Reevaluate percentages for traffic control and mobilization
- Project will be delivered through a design-build contract
- Significant ROW impacts and associated costs ~1/3 of total construction cost
- Constrained by certain design parameters, i.e. access points
- High traffic volumes impacts/impacted by construction
- Rail/transit in the same corridor
- 4th General Purpose lane reduces revenue
- Construction $s saved more significant than O&M $s saved (more important to save upfront construction costs than saving O&M costs)
- Middle section has priority because of $500M set-aside from SH121 project
- $500M set-aside carries requirements
- Assumed maximum allotment from TIFIA
- Current design adds 3-4 lane frontage roads
- Can't displace or impact lake storage
- Recreational 4f issue is primary issue in middle section
- ROW is on easement and not on fee-simple, COE property
- O&M responsibilities are split between General Purpose and Managed Lanes
- To improve operations and revenue on I-35E, improved connections at 635 required which would require additional funding
- Improved connections at 635 would also improve operations and revenue on both corridors (I-35E and 635)
- Smallest traffic volumes on north segment
- Rail line is a major constraint on the north segment
- Rail constraints on the south segment exist
- Multiple access issues in City of Denton
- Merge of I-35E and I-35W are within project limits
- Balancing future aspirations/improvements and stakeholder desires versus available funding is tricky
- Could replace wishbone ramps with slip ramps
- Wishbone versus slip ramps may not be a political issue/concern

SITE VISIT OBSERVATIONS

The following issues and concerns were listed by the VE team following the site visit:

- Lewisville Baptist Church causes constraint on middle segment
- Majority of freeway has substandard design
- Aging structures
- Rolling terrain
- ~30 dealerships along corridor (car, boat, RV)
- Serious congestion during peak hours
- One General Purpose lane drops off north of FM 2181 (from 3 to 2)
- Current HOV lanes drop off after SH121
- New stadium construction and pedestrian overpass constructed before this project
- Lots of at-grade rail crossings at cross streets
- Corridor is fairly developed
- Existing pavement is in poor condition
- Pavement types vary along length of corridor
- FM 407 interchange project was shut down (partially constructed)
- Vertical clearance issues at structures
- Quite a few overhead transmission lines crossing corridor
- Current illumination is maintenance issue
- No direct connectors to the north at SH121 to I-35E

COST MODEL

An analysis of the project cost estimates ranked, as a percentage of overall cost, all construction elements or categories which form part of the overall total project construction cost. This ranking identified the significant cost items and therefore, the *cost drivers* for the project. This ranking helped to guide the I-35E VE team in the development of ideas during the VE study.

The analysis reveals that approximately 80% of the construction cost will occur in approximately 20% of the project elements. For each segment, the rankings illustrate the following:

South Segment:

- The highest cost item, approximately 8% of the total construction cost is Mobilization which is related directly to the function *Initiate Construction.*
- The second highest cost item is Traffic Control, also representing 8% of the total cost and serving the function *Maintain Traffic, Protect Workers/Motorists.*

Middle Segment:

- The highest cost item, approximately 40% of the total construction cost, is Bridges (concrete over Lake Lewisville, both Managed and General Purpose Lanes) which is related directly to the functions *Carry Traffic* and *Span Water.*
- The second highest cost item is Mobilization, representing 8.5% of the total cost and serving the function of *Initiate Construction.*

North Segment:

- The highest cost item, approximately 9% of the total construction costs, is bridges (concrete, General Purpose Lanes) which is related directly to the functions *Carry Traffic, and Separate Grades*.
- The second highest cost item is Retaining Walls, representing 8.5% of the total construction costs, and serving the functions *Minimize ROW and Retain Earth*.

PRELIMINARY ESTIMATE OF PROBABLE CONSTRUCTION COSTS

FUNCTION ANALYSIS

Function analysis results in a unique view of the study project. It transforms project elements into functions, which moves the VE team mentally away from the original design and takes it toward a functional concept of the project. Functions are defined in verb-noun statements to reduce the needs of the project to their most elemental level. Functions are categorized as Basic, Secondary, Required Secondary, Unwanted, Higher Order, and Assumed to further the analysis. Identifying the functions of the project allows a broader consideration of alternative ways to accomplish the functions.

FUNCTIONS				TxDOT
ITEM		FUNCTION

PERFORMANCE CRITERIA MATRIX

The evaluation criteria matrix was used to determine the key evaluative criteria for the project. The VE team listed, with the assistance of the design team and stakeholders, the possible evaluative criteria that could be used to evaluate the creative ideas. These criteria were clearly defined and entered onto a matrix and compared in pairs, asking the question: "Which one is more important to the project?" The letter code (e.g., "a") was entered into the matrix for each pair. After all pairs were discussed they were tallied and percentages calculated. The highest scoring criteria were selected for use in the Evaluation Phase of the study.

The Performance Criteria Matrix is shown below. The definitions and measurement scales for each criterion are included on the following pages.

PERFORMANCE CRITERIA MATRIX
I-35E Managed Lanes project

TxDOT

													TOTAL	%

													45.0	1.0

a	More Important
a/b	Equal Importance

After using the Performance Criteria Matrix to select the criteria, the VE team members further refined the criteria definitions, and defined the scales to be used for each of the criteria. For this project, the performance criteria listed below were selected:

Performance Criteria	Definition	Rating Scale
General Purpose Lanes /Local Traffic Operations	A measure of the efficiency of future traffic operations as they relate directly to the mainline alignment (including on and off ramps) and local traffic	10- LOS "A"; Vol/Capacity = 0.0-0.3; Free flow-excellent operation 9 – LOS "B" Vol/Capacity = 0.31-0.48; Stable flow – very good condition 8 – LOS "C" Stable flow - good operation 7 – LOS "D" Approaching unstable flow – fair operation 6 – LOS "E" Unstable flow- poor operation 4 – LOS "F-0" Traffic congestion for 15 min to 1 hour 3 – LOS "F-1" Traffic congestion for 1 to 2 hours 2 – LOS "F-2" Traffic congestion for 2 to 3 hours 1 – LOS "F-3" Traffic congestion for more than 3 hours
Revenue Impacts	What is the level of impact to the Revenue Collection?	10- Significantly increases revenue collection 9 – 8- 7 – Somewhat increases revenue collection 6- 5 - No apparent difference to revenue collection 4- 3 – Slightly decreases revenue collection 2- 1 – Significantly decreases revenue collection
Stakeholders Acceptance	An approximation of the concept's overall acceptability to non-TxDOT stakeholders and the general public	10- Strong support by all stakeholders and the public 8 – Moderate support from some stakeholders and/or public 5 – Indifference (i.e. either a general lack of interest or no support/opposition is anticipated) 3 – Moderate opposition from some stakeholders and/or the public 1 – Strong opposition from all stakeholders and the public is anticipated

Performance Criteria	Definition	Rating Scale
ROW Impact	A measure of the amount and types of right-of-way (ROW) required.	10 – No ROW required for project 9 – 5 or fewer parcels required; none in residential or commercial use. 7 – 6-10 parcels required; none in residential or commercial use 5 – 5 or fewer residential and/or commercial parcels required 3 – 6-10 residential and/or commercial parcels required 1 – ROW difficult or impossible to obtain (e.g., Native American or military owned property)
Schedule Impacts	What is the level of impact to the project delivery schedule? (both design and construction)	10- Significantly reduces project delivery time 9 – 8- 7 – Somewhat reduces project delivery time 6- 5 - No apparent difference to project delivery time 4- 3 – Slightly delay to project delivery time 2- 1 – Significantly delay to project delivery
Environmental Impact	An approximation of the concept's overall effect on the surrounding environment. This criterion includes the following areas: • Water quality • Endangered species • Socioeconomic resources • Natural resources	10- Major improvement upon existing environment conditions 9 – Measurable improvement upon existing environmental conditions 8 – No environmental impacts 6 – Minor degradation (i.e., does not require mitigation) 4 – Moderate degradation (i.e., requires significant mitigation in one area or limited mitigation in two) 1 – Severe degradation (i.e., requires substantial mitigation in multiple areas.)

PERFORMANCE RATING MATRIX

The performance rating process has been used throughout the VE Study to measure how well the various alternatives accomplish the performance criteria for the project. While the ratings for the individual VE alternatives are included with the documentation of each alternative, this section of the report includes the documentation of the performance ratings of all alternatives combined that were developed during the VE Study.

The rationale for the ratings precedes the rating matrix for each Performance Rating Matrix developed during the VE Study. The Performance Rating Matrices included in this report document the original concepts and the Proposed Alternatives.

The following pages include:

- Performance Rating Matrix – Original Concept
- Performance Rating Matrix – Proposed Alternatives
- Performance Rating Matrix – Accepted Alternatives

Rating Rationale – Original Design

Performance Criteria	Original Design (Baseline)
Revenue Impacts	The inclusion of Managed Lanes (ML) will generate revenue
Traffic OPS – Mainline	With 4 General Purpose (GP) lanes, the traffic operations will be improved significantly; with the option of ML, the Level of Service will be improved even more.
Traffic OPS – Local	There will be 2 to 4 lanes of frontage roads provided along the entire corridor. The local traffic will be improved significantly.
Right of Way Impacts	In order to accommodate the MLs, GPs and frontage roads, many parcels of properties will be acquired.
Environmental Impacts	The air quality will be improved and noise barriers will be installed. The overall environmental impact will be minimized.
Stakeholder Acceptance	The baseline design will improve traffic operations not only on mainlines, also local accesses. High stakeholder acceptance is expected.
Schedule Impact	This is to establish baseline, a neutral number was used.

OVERALL PERFORMANCE	Total Performance	% Perf. Improve.	Total Cost	Value Index (Performance / Cost)	% Value Improvement
Original Concept	589	-	4000	0.15	
VE Set 1	425	-28%	1792	0.24	61%
VE Set 2	583	-1%	3372	0.17	17%

Rating Rationale – VE Alternatives Sets

Performance Criteria	VE Set 1 *Maximize Affordability of Project*	VE Set 2 *Maintain Stakeholder Acceptance*
Revenue Impacts	Revenue will be slightly impacted due to deferral of North Segment. Traffic from North Segment wouldn't be able to utilize MLs.	Revenue will be increased due to deferral of one GP lane/each direction. Early implementation of HOT lanes would also have positive effect to revenue.
Traffic OPS – Mainline	Compared to the baseline, there will be more congestion on the North Segment.	Minor degradation to the traffic operations, compared to the baseline, due to deferral of outside/inside GP lanes.
Traffic OPS – Local	Local traffic operations would have negative impacts due to the deferral of the improvements on North Segment.	No apparent change.
Right of Way Impacts	More than 1/3 of the ROW acquisitions would be deferred, significantly minimized ROW impacts.	ROW impact remains the same as the baseline.
Environmental Impacts	The air quality would not be improved in the North Segment compared to the baseline.	No apparent change compared to the baseline concept.
Stakeholder Acceptance	Due to the deferral of northern part of Middle Segment and North Segment, stakeholders from that area would have negative opinions.	Stakeholders may not favor some of the ideas in VE Set 2.
Schedule Impact	It would take longer to deliver the project due to deferral of northern part of Middle Segment and North Segment.	With interim projects and improvements, projects can be delivered even faster than the baseline concept.

PROJECT DESCRIPTION

INTRODUCTION

The I-35E Managed Lanes project is approximately 28.0 miles long and extends from US 380 in Denton County to I-635 in Dallas County, as shown in **Figure 1**. The existing corridor is a four-lane facility north of Corinth Parkway and a six-lane facility in the south with a one-lane buffer separated, concurrent HOV facility, between I-635 and SH 121 that operates daily and is never closed. A reversible ramp connecting the HOV lane through the I-635 interchange operates on weekdays only and opens in the southbound direction during the morning peak period (6:00-9:00 a.m.), and in the northbound direction during the afternoon peak period (3:30-7:00 p.m.). The I-35E corridor serves as the primary route from Denton to Dallas and the project has been divided into three segments for analysis: south, middle and north. The geographical limit of each segment is derived from the city and county limits, economic activity, geometric configurations, and the traffic characteristics particular to each segment.

The limits of the segments are provided below:

- **South Segment:** I-635 to President George Bush Turnpike (PGBT)
- **Middle Segment:** President George Bush Turnpike (PGBT) to FM 2181/Swisher Road
- **North Segment:** FM 2181/Swisher Road to US 380

PROJECT DESCRIPTION

Existing Configuration

The existing I-35E is a six-lane freeway from I-635 to Quail Run just north of the Lake Lewisville Bridge and a four-lane freeway from Quail Run to US 380. The southern portion of I-35E from I-635 to SH 121 has an interim single lane concurrent high occupancy vehicle (HOV) lane in each direction. To implement this interim HOV lane, the three general purpose lanes in each direction were reduced to a lane width of 11 feet and the inside shoulder was reconstructed to provide space for the HOV lane.

Existing Condition

The section of I-35E under consideration for this project was constructed in the late 1950's and early 1960's as part of the United States Interstate Highway System. Roadway design standards have improved greatly since its initial design and construction. The current roadway exhibits design deficiencies including: inadequate shoulder and lane widths, inadequate ramp acceleration and deceleration distances, inadequate ramp length, inadequate ramp spacing to cross streets, inadequate bridge clearance and unofficial ramps. Additionally, the limited number of existing lanes does not meet the current traffic demands and result in severe congestion. This situation is likely to get worse with future growth and increasing traffic.

Existing Mobility on I-35E

The need for the proposed project is to address the transportation congestion of the area resulting from an increase in population and the subsequent increased travel demand. The proposed project, which traverses Dallas and Denton Counties, is an essential element in the local and regional transportation

system. Within the region, I-35E functions as an interstate highway, serves as the primary north/south commuter corridor between Denton and Dallas, and also serves as a local route for trips to and from work, school, shopping, etc. As an important regional commuter route, I-35E connects the Cities of Dallas, Farmers Branch, Carrollton, Lewisville, Highland Village, Lake Dallas, Corinth, Town of Hickory Creek, and Denton as well as neighboring developing communities.

Proposed Mobility on I-35E

The area adjacent to the I- 35E corridor between Dallas and Denton is in a state of rapid growth and continues to need substantial improvements to the existing transportation system. This growth pattern necessitates substantial transportation improvements to accommodate the projected increases in traffic demand to the already insufficient regional transportation system.

The purpose of the proposed project is to address the transportation needs on the corridor by increasing capacity, reducing traffic congestion, improving mobility, and improving roadway deficiencies within the DFW metropolitan area. The project will also serve to enhance the overall regional and national transportation system.

The proposed improvements for the project include widening the general purpose lanes (free main-lanes) and upgrading the interim concurrent HOV facility by adding a barrier separated bi-directional fully operational and accessible managed lane facility.

The proposed I-35E improvements include increasing the main-lane capacity by:

- Increasing the number of general purpose lanes from six to eight between I-635 and US 377
- Increasing the number of general purpose lanes from four to six between US 377 and I-35W
- Increasing the number of general purpose lanes from four to ten between I-35W and US 380
- Adding a barrier separated bi-directional managed lane facility
    - with four lanes from I-635 to US 77
    - with two lanes from US 77 to I-35W
    - with four lanes from I-35W to US 380
- Providing access to the barrier separated bi-directional managed lane facility at major traffic demand locations such as major intersections and major developed areas along the corridor
- Modifying access to the general purpose lanes to benefit mainlane traffic by decreasing the amount of weaving interaction while maintaining accessibility and conforming to current design standards

The total overall construction cost is currently estimated at $4.0 billion. This total includes the cost of all construction activity to deliver the planned facility, environmental mitigation, right-of-way, utility relocation, and all associated planning, design, and engineering.

DOCUMENTS PROVIDED TO THE VE TEAM

The following project documents were provided to the VE team for their use during the study:

- Slideshow – I-35E Stakeholder briefing, August 2009
- Slideshow – I-35E Stakeholder Presentation, January 2010
- Slideshow – I-35E Stakeholder Presentation, July 2010

- Cost Estimates: full project scope, July 20, 2010
- I-35E managed Lanes Project – Scope Refinement, January 2010
- I-35E Managed Lanes Project – Cost Saving Measures, October 2009
- Project Schematics – South Segment, July 2010
- Project Schematics – Middle Segment, July 2010
- Project Schematics – Modified Middle Segment, July 2010
- Project Schematics – North Segment, July 2010
- Project Schematics – Connection to I-635, July 2010
- Draft Project Level 2 Traffic and Toll Report – I-35E Managed Lanes Between I-635 and US 380, October 2009, Wilbur Smith, October 2009
- Draft White Paper on I-35E Managed Lanes Traffic and Revenue Enhancement, Wilbur Smith, December 2009
- Tolling Schematics – Toll the Toll to Toll Traffic on the CD (only) [CD – Collector Distributor Road]
- Tolling Schematics – Toll the Managed Lanes Traffic and the Toll to Toll Traffic on the CD
- Tolling Schematics – I-35E Configuration between I-635 and US 380 - Toll Gantry Locations - Scenario C – 2017
- Toll Schematics – I-35E Configuration between I-635 and US 380 - Toll Gantry Locations - Scenario C – 2030
- Interstate Access Justification I-35E from I-635 (LBJ) to US 380, August 2009

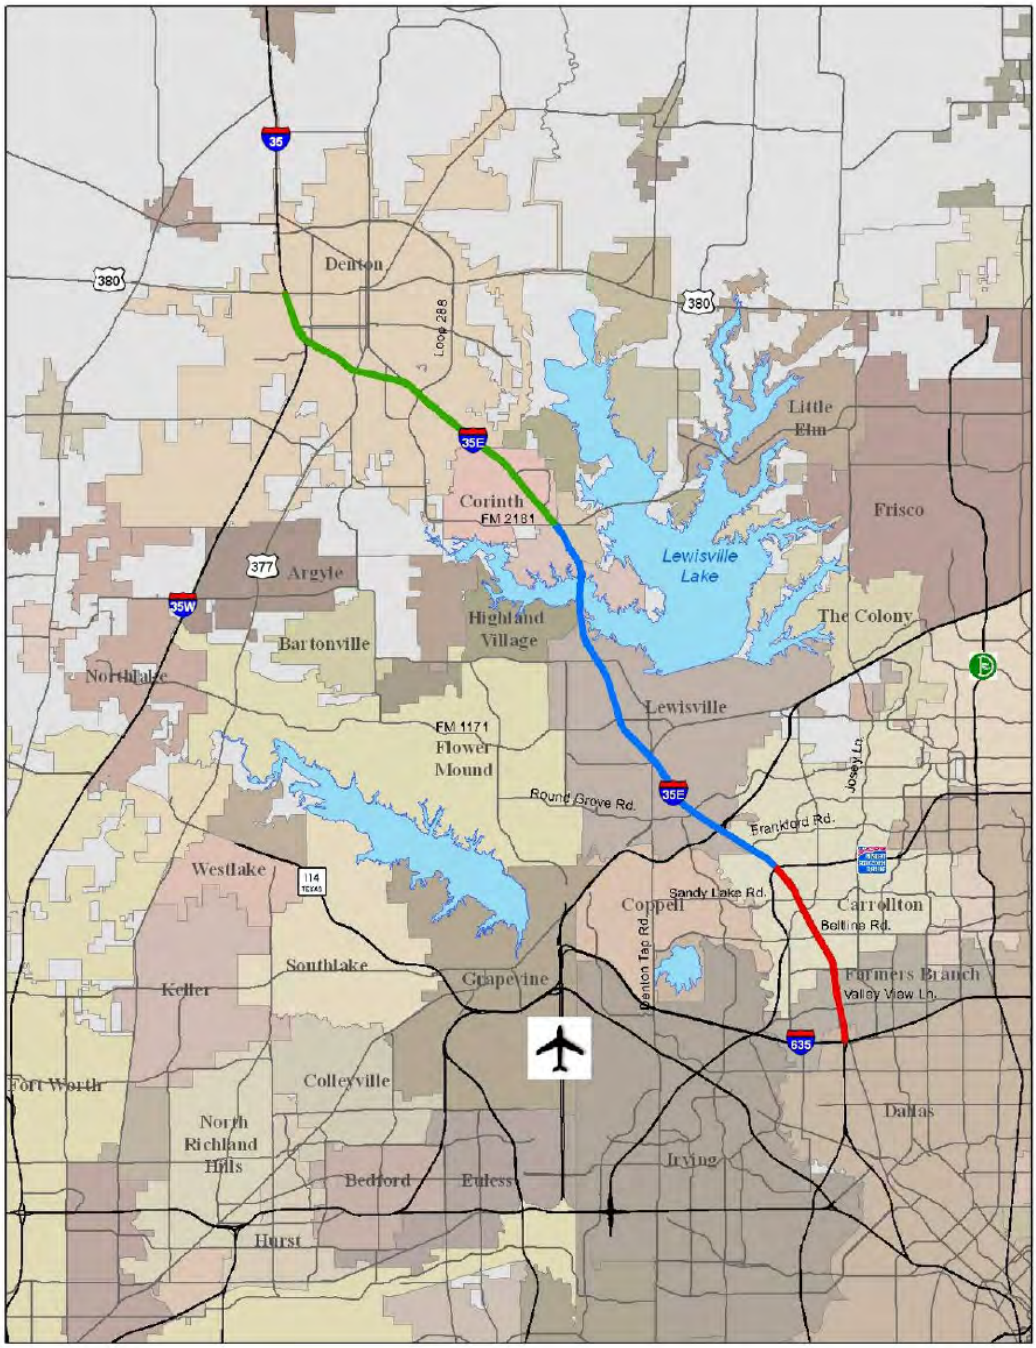
PROJECT DRAWING

Design drawing depicting project location and limits is included on the following page (Fig.1).

PROJECT COST ESTIMATES

The original project estimates are included after the project drawing.

Figure1. Project Map



Comment [D1]: Can we add a north arrow and a legend and/or big labels that show South Segment, Middle Segment, and North Segment?

IDEA EVALUATION

INTRODUCTION

The creative ideas generated by the VE team are carefully evaluated and project-specific criteria are applied to each idea to assure an objective evaluation.

PERFORMANCE CRITERIA

The VE team used the paired comparison method to prioritize the seven key evaluative criteria for this project:

- Revenue Impacts
- Traffic Operations- General Purpose Lanes
- Environmental Impacts
- Stakeholder Acceptance
- Traffic Operations - Local
- Right of Way Impacts
- Schedule Impact

The team enlisted the assistance of the stakeholders and designers to develop these criteria so that the evaluation would reflect their specific requirements.

EVALUATION PROCESS

The VE team, as a group, generated and evaluated ideas on how to perform the various functions. The idea list was grouped by function. While ideas on the overall project were evaluated as a group, ideas relating to a specific technical discipline may have been evaluated by the responsible team member.

The team compared each of the ideas with the original concept for each of the key evaluative criteria to determine whether it was better, equal to, or worse than the original concept. The team reached a consensus on the ranking of the idea. High-ranked ideas would be developed further; low-ranked ones would be dropped from further consideration.

IDEA EVALUATION FORMS

All of the ideas that were generated during the creative phase using brainstorming techniques were recorded on the following Creative Ideas Evaluation forms. These ideas were discussed and the advantages and disadvantages of each were listed.

CREATIVE IDEAS EVALUATION *I-35E Managed Lane Project*			TxDOT/TTA	
No.	**IDEA DESCRIPTION (FUNCTION)**	**Advantages**	**Disadvantages**	**Rank**
GENERAL/PHASING/TRAFFIC CONTROL				
P-1	Allow purchase ROW (by individual parcel or selected) but defer construction of North Segment	• Buy ROW when it's cheaper (assumed) • Phase construction of segments when money is available • Reducing upfront cost by minimum $660M • Revenue collected may be applied later for construction • Minimize ROW impacts at construction • Utility relocation allowed to take place • Prevents undesirable development • By parcel, as it becomes available, is beneficial • TxDOT controls access	• May cost more later to construct • ROW maintenance until built out • Reduces flexibility in design • Must pay ROW costs up front • Bad PR, especially whole-sale purchase • Reduces property taxes • Undesirable land use in interim • Defers development in Denton	4

Ranking Scale:	**5-4 = Most Likely to be Developed**	**3, DS = Design Suggestion**	**1-2 = Least likely to be developed**
Evaluation Criteria:	**WD = Withdraw**	**RQ = Required**	

CREATIVE IDEAS EVALUATION *I-35E Managed Lane Project*			TxDOT/TTA	
No.	**IDEA DESCRIPTION (FUNCTION)**	**Advantages**	**Disadvantages**	**Rank**
P-1a	Defer ROW acquisition and construction of North Segment	• Reduces upfront cost by $1.3B	• Creates hardship for current owners (urban blight) • May cost more later to acquire ROW and to construct • Doesn't help reduce today's congestion • reduction in revenue for middle section • Unable to relocate utilities • Defers development in Denton along corridor	3
P-1b	Lease back ROW to market when available (combine with P-1)	• Sales tax is preserved in interim • Preserving existing land use avoiding urban blight • Additional revenue is generated from lease back fee • Reduced TxDOT maintenance	• Property taxes to local entities are reduced • Administrative burden	4
P-2	defer frontage road construction (entire length)	• Save upfront cost • Minimizes ROW acquisition	• Have to modify design to accommodate • Eliminates access points • Feasibility problems • Constricts construction • Limited application	1

Ranking Scale: **5-4 = Most Likely to be Developed** **3, DS = Design Suggestion** **1-2 = Least likely to be developed**
Evaluation Criteria: **WD = Withdraw** **RQ = Required**

CREATIVE IDEAS EVALUATION *I-35E Managed Lane Project*			TxDOT/TTA	
No.	**IDEA DESCRIPTION (FUNCTION)**	**Advantages**	**Disadvantages**	**Rank**
P-3	defer new frontage road construction (where feasible)	• Save upfront cost (pretty much all bridges) • Reduces maintenance costs • Reduces columns in flood storage area • Use more of existing structure (bridge over lake)	• Access issues • Limited application • May increase cost to construct later	4
P-4	eliminate front road construction (entire length)	• Save upfront cost	• Reduced LOS in GP • Must maintain access to park • Not politically feasible	WD
P-5	defer inside/outside GP lanes (entire length)	• Save upfront cost ~$50M • Enhances start-up revenue • Allows flexibility for future uses • Flexibility could be used for future ML instead of a GP lane	• May cost more later • Drainage • More difficult to construct • More difficult traffic control plans to construct inside lane	5
P-6	identify critical breakout/early projects	• Bottleneck reduction • Political incentive to get on board for entire project because of success in improving mobility • Traditional funding sources for breakout projects • Minimizes impacts of railroad coordination	• May not be as cost-effective • Introducing schedule risk • Probably more throw-aways	4

Ranking Scale: **5-4 = Most Likely to be Developed** **3, DS = Design Suggestion** **1-2 = Least likely to be developed**
Evaluation Criteria: **WD = Withdraw** **RQ = Required**

No.	**IDEA DESCRIPTION (FUNCTION)**	**Advantages**	**Disadvantages**	**Rank**
P-9	use rigid pavement	• Lower maintenance costs • Less urban heat • More suitable for TxDOT doing maintenance • Longer pavement life • Allow bids for alternate pavement sections	• Possibly more upfront costs • Longer construction duration • Higher noise	DS
P=9a	allow precast pavement options	• Reduces construction duration	• Increased cost	DS
P-10	use alternative materials for bridges (fiber reinforced polymers)	•	•	DS
P-11	maximize use of standard spans on bridges (geometric adjustments)	•	•	DS
P-12	early implementation of HOT lanes (convert existing HOV to HOT) – allowed under current legislation	• Generates revenue early • Could be very marketable during construction	• Duplicate toll equipment installation costs • Creates constructability issues when ultimate construction begins	5

Ranking Scale: **5-4 = Most Likely to be Developed** **3, DS = Design Suggestion** **1-2 = Least likely to be developed**
Evaluation Criteria: **WD = Withdraw** **RQ = Required**

CREATIVE IDEAS EVALUATION *I-35E Managed Lane Project*			TxDOT/TTA	
No.	**IDEA DESCRIPTION (FUNCTION)**	**Advantages**	**Disadvantages**	**Rank**
P-13	defer ROW acquisition and construction of northern part of middle section and north section (defer Garden Ridge north)	• Reduces upfront cost significantly • Defers cost of mitigation to COE property • Defers maintenance costs • Moves towards a more financially viable project	• Creates hardship for current owners (urban blight) • May cost more later to acquire ROW and to construct • Doesn't help reduce today's congestion • reduces revenue for middle section • Unable to relocate utilities • Defers development in north along corridor • Reduces LOS north of Lake • Reduces alternate routes for incident management	4
P-14	shared 10' shoulder/buffer between GP and ML	• Eliminates cost of barrier and shoulder pavement • Reduces ROW costs • Reduces maintenance costs • Reduces capital costs	• Does not serve as a breakdown lane • No positive barriers between ML and GP • Replace pylons • Could potentially increase bridge spans • Higher potential for leakage • Increase toll collection infrastructure costs • More onerous traffic management	3
P-15	reduce all lanes to 11' (used currently on Central)	• Reduces capital costs • Reduces ROW costs	• Reduces LOS equires design exception on GP	2

Ranking Scale: **5-4 = Most Likely to be Developed** **3, DS = Design Suggestion** **1-2 = Least likely to be developed**
Evaluation Criteria: **WD = Withdraw** **RQ = Required**

VALUE ENGINEERING PROCESS

INTRODUCTION

The Value Engineering (VE) process involves fourteen activities needed to accomplish a VE study, organized in three parts: Preparation, VE Study, and Report. The following VE Activities Chart describes each activity; the individual tasks are summarized below.

PREPARATION

Prior to the start of the VE study, representatives from TxDOT-Dallas District, TTA CDA Program Management and VE Team Leader carried out the following three activities:

- **Initiate Study** – Identified study project, defined study goals, and prepared draft study charter.
- **Organize Study** – Conducted preparation meeting, selected team members, and finalized study charter.
- **Prepare Data** – Collected and distributed data and prepared cost models.

All of the information gathered prior to the VE Study was given to the team members for their review and use.

VE STUDY

There were ten activities carried out by the VE team during the performance of the study, organized in three segments:

Segment 1

- **Inform Team** – Receive designer presentation, develop performance criteria, and visit project site.
- **Analyze Functions** – Identify basic functions and cost drivers.
- **Create Ideas** – List a large quantity of alternative ideas and use group/individual brainstorming.
- **Evaluate Ideas** – Evaluate all ideas against performance criteria and rank all ideas.

Segment 2

- **Develop Alternatives** – Develop high-ranked ideas into VE alternatives and measure performance.

- **Critique Alternatives** – Team review of alternatives to develop and ensure team consensus and technical viability. Develop and rate recommended VE alternatives.

- **Present Alternatives** – Give interim presentation of alternatives and prepare and issue preliminary VE report.

Segment 3

- **Assess Alternatives** – Review alternatives and prepare draft implementation decisions (*TxDOT Management*).

- **Resolve Alternative** – Resolve dispositions, edit and revise alternatives, and summarize results (*TxDOT Management*).

- **Present Results** – Publish Final VE Study Report.

VE REPORT

- **Publish Results –** Prepare Final VE Report and distribute printed and electronic copies.

The VE study is complete when the report is issued as a record of the VE team's analysis and development work as well as the project development team's implementation dispositions for the alternatives.

Performance measures are integral to the VE process and are used throughout the VE Study. The following detailed discussion of the performance measures provides better clarification of how they are used within the VE process. A VE Study Activity Chart, which outlines the fourteen VE activities in more detail, follows the performance measures. The VE Study Agenda and Meeting Attendees sheet, which document the schedule and participants in the VE Study, are at the end of this section.

PROJECT PERFORMANCE MEASUREMENT

INTRODUCTION

The methodology described herein measures project value by correlating the performance of project scope and delivery to the project costs. The objective of this methodology is to prescribe a systematic, objective approach to study and optimize a project budget, schedule, and scope. This serves the transportation community by identifying a quantifiable methodology to effectively analyze and compare three project management components (scope, schedule, and budget), and measure resulting project value.

Project performance measures are an integral part of the Value Engineering (VE) methodology and consist of a set of techniques as follows:

- Identify key project (scope and delivery) performance criteria for the project
- Establish the hierarchy and impact of these criteria on the project
- Establish the baseline of the current project performance by evaluating and rating the effectiveness of the current design concepts
- Identify the change in performance of alternative project concepts generated by the study
- Measure the aggregate effect of alternative concepts relative to the baseline project's performance as a measure of overall value improvement

It is important that the project performance criteria be well defined and agreed to by the VE team members at the start of the study as they are used throughout the study to identify, evaluate, and document alternatives. Project scope performance improvements are also one of the critical quantifiable results of a VE study. All subsequent references to "project scope and delivery performance" will be abbreviated to "performance".

The primary goal of value engineering is to improve project value. A simple way to think of value in terms of an equation is as follows:

$$\text{Value} = \frac{\text{Project Performance (Scope \& Delivery)}}{\text{Project Cost}}$$

Value engineering has traditionally been perceived as an effective means for reducing project costs. This paradigm only addresses one part of the value equation, often at the expense of overlooking the role that VE can play to improve project performance. Project costs are fairly easy to quantify and compare through traditional estimating techniques. Performance is not so easily quantifiable.

A unique methodology using a variety of techniques aimed at identifying, defining, and quantifying performance is used. Once this has been accomplished, the interrelationship between cost and performance can be quantified and compared in terms of how they contribute to overall value.

The direct and active involvement of the project's stakeholders is at the core of this process. The VE Team Leader will lead team members through the methodology, using the power of the process to distill subjective thought into an objective language that everyone can relate to and understand. The dialog that develops forms the basis for the VE team's understanding of the performance requirements of the project and to what degree the current design concept is meeting those requirements. From this baseline, the VE team can focus on developing alternative concepts that will quantify both performance and cost and contribute to overall project value.

The approach to project performance yields the following benefits:

- Builds consensus among project stakeholders (especially those holding conflicting views)
- Develops a better understanding of a project's goals and objectives
- Develops a baseline understanding of how the project is meeting performance goals and objectives
- Identifies areas where project performance can be improved through the VE process
- Develops a better understanding of a VE alternative's effect on project performance
- Develops an understanding of the relationship between performance and cost in determining value
- Uses value as the true measurement for the basis of selecting the right project or design concept
- Provides decision makers with a means of comparing costs and performance (i.e., costs vs. benefits) in a way that can assist them in making better decisions

METHODOLOGY

The application of performance methodology consists of the following steps:

1. Define the major performance criteria
2. Determine the relative importance of the criteria
3. Establish the performance "baseline" for the original design
4. Evaluate the performance of the VE alternative concepts
5. Compare the performance rating of alternative concepts to the "baseline" project.

Assumptions

Before embarking on the details of this methodology some assumptions need to be identified:

- An evaluation of the creative ideas (ideas generated during the brainstorming, creative sessions-not to be confused with VE alternative concepts described in Step 4) is done between Step 3 and 4. The idea evaluation process remains true to the "value" approach of measuring performance and costs; however, due to the time constraints, the idea evaluation is a qualitative form of evaluating ideas, as opposed to the quantitative procedures done in the other steps.

- The methodology described in the following steps assumes the project functions are well established. Project functions are "the what" the project delivers to its users and stakeholders; a good reference for the project functions can be found in the environmental document's purpose and need statement. Project functions are generally well defined prior to the start of the VE Study. In the event that project functions have been substantially modified, the methodology must begin anew from the beginning (Step 1).

Step 1 – Determine the Major Performance Criteria

The VE Team Leader will initially request that representatives from TxDOT identify performance criteria that they feel are essential to meeting the overall need and purpose of the project. Usually four to eight criteria are selected. It is important that all potential criteria be thoroughly discussed. The information that comes out of this discussion will be valuable to both the VE team and TxDOT. It is important that the criteria be discretely defined, and they must be quantifiable in some form. By quantifiable, it is meant that a useable scale must be delineated with values given on a scale of 1 to 10. A "1" indicates poor value while a "10" indicates excellent value. Every effort should be made to make the ratings as objective as possible.

Step 2 – Determine the Relative Importance of the Criteria

Once the group has agreed upon the project's performance criteria, the next step is to determine their relative importance in relation to each other. This is accomplished through the use of an evaluative tool termed in this paper as the "Performance Criteria Matrix." This matrix compares the performance criteria in pairs, asking the question: "Which one is more important to the project?" A letter code (e.g., "a") is entered into the matrix for each pair identifying which of the two is more important. If a pair of criteria is considered to be essentially equal importance, both letters (e.g., "a/b") are entered into the appropriate box. This, however, should be discouraged, as it has been found that in practice a tie usually indicates that the pairs have not been adequately discussed. When all pairs have been discussed, the number of "votes" for each is tallied and percentages (which will be used as weighted multipliers later in the process) are calculated. It is not uncommon for one criterion to not receive any "votes". If this occurs, the criterion is given a token "vote", as it made the list in the first place and should be given some degree of importance.

It is important for the VE Team Leader to remind the group that as they evaluate each pair of criteria they should think of performance trade-offs in hypothetical terms as they relate to the project's overall need and purpose. The team should also be reminded that these performance criteria will be used to evaluate the merits of alternative concepts generated during the course of the VE Study. As such, the group should keep an open mind and base their evaluation on what is possible rather than what exists in terms of the current design concept.

Step 3 – Establish the Performance "Baseline" for the Original Design

The next step in the process is to evaluate how well the original design is addressing the project's performance criteria. This step establishes a "baseline" against which the VE alternative concepts can be compared. The Performance Rating Matrix is used to assist the VE team in determining the performance ratings for the original design concept. Representatives from the VE team next begin assigning a 1 to 10 rating for each criterion, using the definitions and scales developed in Step 1.

Once the 1 to 10 rating for the various criteria have been established, their total performance should be calculated by multiplying the criteria's weight (which was developed in Step 2) by its rating. Once the total performance for each criterion has been determined, the original design's total performance can be calculated by adding all of the scores for the criteria. The concept's total performance will be somewhere between 100 and 1,000 points. A concept scoring 1,000 would represent a hypothetically "perfect" design concept, with all performance criteria being addressed to their theoretical maximum. This numerical expression of the original design's performance forms the "baseline" against which all alternative concepts will be compared.

Step 4 – Evaluate the Performance of the VE Alternative Concepts

Once the performance baseline has been established for the original design concept, it can be used to help the VE team develop performance ratings for individual VE alternative concepts as they are developed during the course of the VE Study. The Performance Measures form is used to capture this information. This form allows a side-by-side comparison of the original design and VE alternative concepts to be performed.

It is important to consider the alternative concept's impact on the entire project, rather than on discrete components, when developing performance ratings for the alternative concept.

Step 5 – Compare the Performance Ratings of Alternative Concepts to the "Baseline" Project

The last step in the process completes the Performance Rating Matrix that was initially begun to develop the performance ratings for the original design concept. The VE team totals the VE alternatives, as a "set", to provide the decision makers a clear picture of how the alternatives fit together into possible solutions. This "set" of VE alternatives is rated and compared against the original concept. The performance ratings developed for the VE alternative set are entered into the matrix and the summary portion of the Performance Rating Matrix is completed. The summary provides details on net changes to cost, performance, and value using the following calculations.

- % Performance Improvement = Δ Performance VE Alt. Set / Total Performance Original Concept
- Value Index = Total Performance / Total Cost (in Millions)
- % Value Improvement = Δ Value Index VE Alt. Set / Value Index Original Concept

The Performance Rating Matrix shows the numerical change for each performance measure and alternative set. The Total Performance is calculated by multiplying the criteria weight by the performance rating for each performance measure of either the original concept or VE set.

CONCLUSION

The development and integration of performance measurements into the value methodology employed on VE studies has improved the effectiveness of the VE Program as applied to projects by providing a reliable, integrated method of measuring performance and, consequently, value. This in turn has allowed the program to more easily discuss disposition of the alternatives, justify alternatives with cost increases, apply value engineering more effectively to projects in the earlier stages of project development, and to better capture input from participating project stakeholders.

The application of performance measurements within a VE Study neither supplants nor reduces the authority of the Project Development Team from developing, analyzing, and refining the project scope issue contained in the above two major categories. The intent of the project (scope) performance measurements within the context of a VE Study is for the VE team to address the relevant project scope issues. These may help the Project Development Team, but they do not supplant their role as the final decision makers on the project scope.

Value Engineering Study Activity Chart

PREPARATION

INITIATE STUDY — 1
- Identify study project
- Identify study roles and responsibilities
- Define study goals
- Select team leader

ORGANIZE STUDY — 2
- Conduct preparation meeting
- Select team members and advisors
- Identify stakeholders, decision-makers
- Identify data collection
- Select study dates
- Determine study logistics

PREPARE DATA — 3
- Collect and distribute data
- Develop construction cost models

VE STUDY

Segment 1

INFORM TEAM — 4
- Review study activities and confirm reviewers
- Present design concept
- Present stakeholders' interests
- Review project issues and objective
- Develop key functions and performance criteria
- Visit project site

ANALYZE FUNCTIONS — 5
- Analyze project data
- Expand project functions
- Determine functional cost drivers

CREATE IDEAS — 6
- Focus on functions
- List all ideas
- Apply creativity and innovation techniques

EVALUATE IDEAS — 7
- Apply key performance criteria
- Rate each idea
- List advantages and disadvantages
- Rank all ideas
- Assign alternatives for development

Segment 2

DEVELOP ALTERNATIVES — 8
- Develop alternative concepts
- Prepare sketches and calculations
- Measure performance
- Estimate costs, Life Cycle Costing (LCC) benefits/costs, if applicable

CRITIQUE ALTERNATIVES — 9
- VE Alternatives Team Consensus Review

PRESENT ALTERNATIVES* — 10
- Present findings
- Document feedback
- Confirm pending reviews
- Prepare preliminary report

**Informal presentation of study findings*

Segment 3

ASSESS ALTERNATIVES* — 11
- Review preliminary report
- Assess alternatives for project acceptance
- Prepare draft implementation dispositions

**Activities performed by Project Development Team (PDT) and Stakeholders*

RESOLVE ALTERNATIVES — 12
- Review implementation dispositions
- Resolve implementation actions with decision -makers and stakeholders
- Edit alternatives
- Revisit rejected alternatives, if needed

PRESENT RESULTS* — 13
- Present results
- Obtain management approval on implemented alternatives
- Summarize performance, cost, and value improvements

**Preferred presentation- formal*

REPORT

PUBLISH RESULTS — 14
- Document process and study results
- Incorporate all comments and implementation actions
- Distribute printed report
- Distribute electronic report to TxDOT

VE STUDY AGENDA

Monday, August 16, 2010

Information Phase

9:00-9:05	Introductions (All)
9:05-9:45	Brief overview of the VE Process (*Martin Hsu, Team Leader*)
9:45-10:30	Project Overview (*Project Manager and Engineers*)
10:30-11:00	Stakeholder Issues (All)
11:00-12:00	Function Identification, Performance Criteria Development, Rating of Baseline (All)
12:00-1:00	Lunch
1:00-5:00	Site Visit **(VE Team members only)**

Tuesday, August 17, 2010

9:00-9:30	Recap of First Day/Additional Information Review
9:30-11:00	Review/Discussion of Baseline Cost Estimate

Function Analysis Phase

11:00-12:00	Function Analysis/*Fast Diagram*
12:00-1:00	Lunch
1:00-2:00	Function Analysis/Fast Diagram (continued)

Creative/Speculation Phase

2:00-5:00	Team Brainstorming

Wednesday, August 18, 2010

8:00-10:00	Team Brainstorming (Continued)

Evaluation Phase

10:00-12:00	Evaluation of Ideas
12:00-1:00	Lunch
1:00-4:00	Evaluation of Ideas, Team Assignments for Development
4:00-5:00	Review Alternative Development Process

Monday, August 23, 2010

Development Phase

8:00-9:00	Review of VE Alternatives Meeting (Reality Check)
9:00-10:00	Review/Distribution of Handouts and VE Alternative Forms
10:00-12:00	Alternative Development
12:00-1:00	Lunch
1:00-5:00	Alternative Development

Tuesday, August 24, 2010

8:00-12:00	Alternative Development
12:00-1:00	Lunch
1:00-3:30	Finalize VE Alternative Development
3:30-5:00	Finalize Team Review of VE Alternatives

Wednesday, August 25, 2010

Presentation Phase

8:00-10:15	Group Review, prepare for Presentation
10:15-12:30	**Presentation of VE Alternatives to Management and Stakeholders**
